## Acknowledgements

It gives me immense pleasure to express my profound gratitude to my research supervisor Dr. G. Satyanarayana, for giving me an opportunity to work with him in his research group. I am eternally thankful him all the time for his valuable guidance, encouragement and constant motivation during my research in the lab. I will always remain grateful to him and consider myself privileged to be associated with him.

## I sincerely thank:

* Head of the Department (Prof. F. A. Khan) and other faculties of the Department of chemistry IIT Hyderabad.
* Late Prof. A. Srikrishna (IISc Bangalore).
* Prof. K. R. Prasad (IISc Bangalore), Prof. Martin E Maier (Universität TübingenGermany), Dr. Dattatraya H. Dethe (IIT-Kanpur), Dr. Santosh J Gharpure (IITBombay) and Dr. P. C. Ravi Kumar (IIT Mandi) towards their valuable suggestions.
* Faculties during my master degree Dr. Y. Jayaprakash Rao, Prof. M. Adinarayana, Prof. P. Venkateswar Rao, Prof. K. Nageswar Rao, Prof. P. Jaya Prasada Rao.
* My B. Sc. teachers Mr. Jagadeeshwar Reddy and Mr. Venkateshwar Reddy.
* My previous organization colleagues (Dr. Reddy’s Laboratories Pvt. Ltd) Dr. P. Pratap Reddy, Dr. P. V. R Acharyulu, Dr. Cherukupalli Praveen, Dr. G. Madhusudhan Reddy, Dr. Y. V. Madhavi, Dr. N. Srinivas, Dr. R Vijaya Anand, Dr. Arnab Roy, Dr. Dinesh Bhalerao, Dr. Rakeshwar Bandichhor, Dr. Pranab Haldar, Dr. P Seetha Rama Sarma, Dr. K. Srihari Babu, Mr. P. Srinivas, Mr. V. Krishna, Mr. P. Narasimha Rao, Mr. I. Babu and Mrs. P. Shailaja.
* Dr. K. Srinivas (Scientist-IICT-Hyderabad) and Dr. Y. V. Madhavi (Asst. prof. NIPER-Hyderabad) for their valuable support towards the upgradation from JRF to SRF.
* Dr. A. Gopi Krishna Reddy and Mr. Md. Samiuddin for recording NMR spectra.
* Mr. L. Mahendar and Mr. Md. Samiuddin for recording the HR-MS spectra.
* Dr. K. Ravi Kumar and Mr. Kishor Sudhir Naktode for X-Ray difractometer measurements and analysis of single crystal samples.
* Mr. L. Mahendar for recording IR samples.
* Technical and non-teaching staff of IIT Hyderabad, in particular Mr. M. Kumar Das, Mr. Sadique, Mr. Mosim, Mr. Srinivas, Mr. Shiva, Mr. Rajesh, Mr. Sastry, Mr. Lingamaiah, Mr. Vijay, Mr.Rama Krishna and Mr. Praveen for their support.

#### Abstract

Constituting a carbon-carbon bond is one of the most fundamental operations in organic synthesis. In general, the synthesis of organic molecules involves a step-wise operation for the construction of individual bonds. These synthetic transformations become more efficient and viable when several bonds are formed in a one-pot fashion and/or in a sequential one-pot manner without isolating the reaction intermediates/intermediate products, such reactions can be called as domino or sequential domino one-pot reactions, respectively. The latter one would be feasible by altering the reaction conditions or by the addition of reagents to promote the subsequent reaction(s) once after the initial step(s) is/are completed. Particularly, the domino processes promoted by [Pd]-catalysis possesses a great potential for elaboration and the development of new synthetic methods that eventually represent a new frontier to conquer in organic chemistry. These domino strategies elaborate the scope of the traditional cross-coupling chemistry due to more efficient and fast construction of molecular complexity from comparatively uncomplicated building blocks. Such transformations are also called as tandem, sequential, cascade, consecutive, iterative, zipper or one-pot (one-flask) reactions and these link several transformations together in a single synthetic operation. Domino reactions have gained wide acceptance due to increase in efficiency of a reaction by decreasing the number of synthetic transformations, the quantity of reagents and solvents used for workup procedures, column chromatography and minimization of waste and energy. Therefore these reactions have their own significance with respect to ecological and economical aspects.

## Synthesis 7-Methyl-5H-dibenzo[a,c][7]annulen-5-ones via domino [Pd]catalysis:

Therefore, we became interested in the development of novel [Pd]-catalyzed domino transformations in a one-pot or sequential one-pot manner. As a result, in the first chapter, we have presented a domino [Pd]-catalyzed transformation, for the synthesis of
novel 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones 2 starting from simple 2bromoacetophenones 1. The reaction might proceed through an unprecedented path that benefits the entire process by constructing a C-C $\sigma$-bond (i.e., intermolecular homo biaryl coupling) and a $\mathrm{C}=\mathrm{C} \pi$-bond (i.e., intramolecular Aldol type condensation), as depicted in Scheme 1. Although, the product 7-methyl-5H-dibenzo[a,c][7]annulen-5ones 2 was obtained in moderate yields, for a one-pot domino process of two individual steps (i.e., biphenyl coupling and Aldol condensation) it accounted for approximately $70 \%$ yield of each individual step. Therefore, the method is still considered to be an efficient one. Furthermore, the present method was found to be significant when compared to earlier reports which involved not less than four steps with an overall $15 \%$ yield to accomplish such structurally relevant compounds.

Scheme 1

Significantly, 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones 2 represents the entire carbon core structure of biologically active dibenzocycloheptanoid (3-5) and colchicinoid (6-8) based natural products (Figure 1).

Figure 1

## Synthesis of $\alpha$-aryl ketones via [Pd]-catalysis:

After the accomplishment of 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones 2, we were interested to know the outcome in the presence of external haloarenes. Therefore, 2-bromoacetophenones $\mathbf{1}$ were treated with external iodoarenes $\mathbf{9}$ in the presence of a [Pd]-catalyst. To our surprise, the expected bi-aryl product was not observed, rather impeded at $\alpha$-arylation and furnished $\mathbf{1 0}$ without affecting the bromo-substituent of $\mathbf{1}$. The reaction was successful under slightly different conditions to that mentioned in Scheme 2. The reaction was amenable with different iodoarenes 9 having electron withdrawing and electron donating substituents on the aromatic ring. The reaction was completed in a shorter reaction time (i.e., typically 45 min to 3 h ) and furnished the $\alpha$ arylation products $\mathbf{1 0}$ in very good yields as shown in Scheme 2.

## Scheme 2

## Synthesis of bi-aryls via domino [Pd]-catalysis:

After the successful accomplishment of 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones 2 and the synthesis of $\alpha$-arylation products $\mathbf{1 0}$ through [Pd]-catalysis, we were fascinated about the outcome when 2-bromoarylisopropyl ketones $\mathbf{1 1}$ or 2bromoarylcyclohexylketones $\mathbf{1 2}$ were subjected to palladium catalysis. Hence, 2bromoarylisopropyl ketones $\mathbf{1 1}$ or 2-bromoarylcyclohexylketones $\mathbf{1 2}$ were reacted in the presence of the [Pd]-catalyst. Quite surprisingly, slight modification of the reaction conditions (i.e., with base $\mathrm{K}_{2} \mathrm{CO}_{3}$ and solvent toluene), showed a dramatic effect and was furnished only the bi-aryl products $\mathbf{1 3 / 1 4}$ in a controlled fashion (Scheme 3).

Scheme 3

In addition to the NMR and other spectroscopic studies for structural elucidation, the structure of bi-aryl $\mathbf{1 3}$ was further unambiguously confirmed by single crystal X-ray diffraction analysis (Figure 2).

Figure 2

Significantly, the biaryl core constitutes a privileged structural motif that is found in approximately $4.3 \%$ of all biologically active natural products. Some of the notable examples are (+)-isoschizandrin 15, valoneaic acid 16 and valsartan 17 (Figure $3)$.

Figure 3

## Synthesis of $\beta$-aryl allylic alcohols via [Pd]-catalysis:

In continuation with our research interest on [Pd]-catalysis in the second chapter, it was envisioned that the targeted dihydrochalcones $\mathbf{1 8}$ could be achieved by employing [Pd]-catalyzed cross-coupling of aryl halides $\mathbf{1 9}$ with allylic alcohols 20 under traditional Jeffery-Heck conditions (Scheme 4).

## Scheme 4

Therefore, the palladium catalyzed coupling was carried out between the aryl iodide 19 and the allylic alcohol 20, under typical Jeffery-Heck conditions. To our
surprise, exclusively $\beta$-aryl allylic alcohol 21 was isolated rather than the expected $\beta$ aryl carbonyls 18. Based on the careful study of the literature, we realized that the usual Heck followed by double bond isomerization to give the carbonyl compounds was observed only for those substrates having no ortho-substituents on the aromatic ring of the allylic alcohols. As a result, from the present study, it was thought that the bromosubstituent at the ortho-position on the aromatic moiety of the allylic alcohol plays a major role to confine the rotation around $\mathrm{C}-\mathrm{C}$ bond of the $\mathrm{PdCH}-\mathrm{CH}(\mathrm{OH}) \mathrm{Ar}$ intermediate. The reason for the restricted rotation of the Pd-intermediate around the CC bond may be due to the more bulky nature of ortho-bromoaryl moiety of the allylic alcohol and thus suppresses the formation of enol via the double isomerization. As a result, the reaction impeded after Mizoroki-Heck coupling and furnished $\beta$-aryl allylic alcohol 21.

Thus, the optimized conditions were applied to different aryl iodides 19 in conjunction with allylic alcohols 20. Interestingly, the method was quite successful on a variety of aryl iodides $\mathbf{1 9}$ in combination with allylic alcohols $\mathbf{2 0}$, and furnished the corresponding products 21 in fair to very good yields using conventional conditions ( 60 to $84 \%$, Scheme 5). Also, it was found that the reaction was amenable under microwave irradiation condtions and delivered products 21 in comparable yields to that of conventional ones (56 to $86 \%$, Scheme 5).

20

19

## Scheme 5

Interestingly, the method was also successful with 1-bromo-2-iodobenzenes 22 as well as 2-bromobenzaldehydes $\mathbf{2 3}$ as coupling partners to the allylic alcohols $\mathbf{2 0}$ and furnished $\beta$-aryl allylic alcohols 24/25 (Scheme 6).

Scheme 6

Assuming that the steric hindrance of the substituents at the ortho position accounted for the resulting $\beta$-aryl allylic alcohols and to probe this hypothesis of ortho effect, bromine at ortho position was replaced with methoxy or methyl group. Finally, to better understand the nature of steric and electroinc factors that influence the selective formation of $\beta$-aryl allylic alcohols $\mathbf{2 1 / 2 4} / \mathbf{2 5}$, we performed the reaction by choosing 2-methoxy/methyl aryl allylic alcohol $26 / 27$ as coupling partners. As expected, the reaction favored the formation of $\beta$-aryl allylic alcohols 28-32 as a major product in a highly regio- and stereoselective manner along with the $\beta$-aryl carbonyls $\mathbf{2 8} \mathbf{\prime}^{\mathbf{- 3 2}}{ }^{\prime}$ as minor products (Scheme 7).

## Scheme 7

## Sequential one-pot approach for the synthesis of 1, 3-

 dihydroisobenzofurans via [Pd]-catalysis:Significantly, the above method enabled us with interesting $\beta$-aryl allylic alcohols with dense functionality on either of the aromatic rings. Amongst the $\beta$-aryl allylic alcohols $\mathbf{2 1}, \mathbf{2 4}, \mathbf{2 5}, \mathbf{2 8}, \mathbf{2 9}, \mathbf{3 0}, \mathbf{3 1} \& 32$ those with aldehyde functionality on the aromatic ring (i.e., 25) appeared to be the potential synthetic precursor for the synthesis of oxygen containing heterocyclic compounds. In this regard, we envisioned a short and efficient synthesis of interesting cyclic ethers such as benzoxepines 33 or 1,3dihydroisobenzofurans $\mathbf{3 4}$ that could be possible by employing reduction and acid mediated intramolecular cyclization protocol on $\beta$-aryl allylic alcohols 20. According to our retrosynthetic analysis, the possible benzoxepine $\mathbf{3 3}$ or 1,3-dihydroisobenzofurans 34 can be obtained by acid mediated cyclization of diol, which in turn can be synthesized easily from reduction of readily synthesized $\mathbf{2 5}$ (Scheme 8).

Scheme 8

Thus, the [Pd]-catalyzed coupling of 2-bromobenzaldehydes 23 with the allylic alcohols 20 followed by $\mathrm{NaBH}_{4}$ induced in-situ reduction of the coupled aldehyde products 25 gave the desired diols 35 . In order to make the method more efficient, the crude diols 25 without the column purification was subjected to the Lewis acid $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right)$ mediated cyclization at $-40{ }^{\circ} \mathrm{C}$. Gratifyingly, the reaction was found to be smooth on the crude diols 35 (i.e., on the crude diol 25 which was obtained after the work-up followed by concentration under reduced pressure) and exclusively furnished the product 34 in moderate over all yields (Scheme 9). This may be due to the reason that the formation of five membered cyclic ether $\mathbf{3 4}$ would be feasible over the seven membered one 33. It is worth mentioning that, although, the yields of the cyclic ether products 34 are moderate, they actually represent the overall yield of three individual reactions. Therefore, each step contributes for at least $75 \%$ yield and hence the method still stands efficient.

## Scheme 9

Oxygen containing heterocyclic compounds are widely assayed for their substantial therapeutic applications such as tetrahydroisobezofurans motifs. They are pervasive structural elements in biologically relevant small molecules (Figure 4). 3Deoxyisochracinic acid 36 was isolated from cladosporium species shows antibacterial activity by inhibiting the growth of B.subtilis. The cyclic ether pestacin 37 was obtained from microorganism pestalotipsis microspore and shows antifungal, antimycotic and antioxidant activity. FR $198248 \mathbf{3 8}$ was isolated from aspergillus flavipes F543 whereas FR 20230639 was obtained from aspergillus terreus 13830. Both of them show antibacterial activity and inhibitory activity against staphylococcus aureus peptide deeformylase and also exhibit anti-influenza activity (Figure 4).

Figure 4

## Domino [Pd]-catalysis: synthesis of bi-aryl acetylenes:

In the third chapter, we have described a domino [Pd]-catalysis by the direct cross coupling of commercially available simple and cheap lithium acetylide (i.e., as the source of acetylene) with aryl halides, in a domino one-pot manner. At first this method was successfully implemented on bromoarenes 40 as coupling partners for the synthesis of symmetrical bi-aryl aceteylenes. Significantly, the reaction showed a wide range of functional group tolerance. For example, halo arenes with alkyl, aryl, alkyloxy, chloro, trifluoromethyl and nitro groups were successful in delivering the bi-aryl aceteylenes 41. Interestingly, the reaction was successful with hetero aryl bromides as well. To further check the scope of the method, we next explored the reaction with iodoarenes 19 as coupling partners. Quite interestingly, the reaction showed a very good functional group tolerance, particularly, when there was a bromo-substituent along with iodo one on the aromatic ring, the bromo-substituent did not involve in the reaction and remained intact in the products (Scheme 10).

# CHAPTER I 

# DOMINO [Pd]-CATALYSIS: SYNTHESIS OF 7-METHYL-5H-DIBENZO[a,c][7]ANNULEN 

-5-ONES AND BI-ARYLS

## I. 1 INTRODUCTION:

Constituting a carbon-carbon bond is one of the most fundamental operations in organic synthesis. In general, the synthesis of organic molecules involves a step-wise operation for the construction of individual bonds. These synthetic transformations become more efficient and viable when several bonds are formed in a one-pot fashion and/or in a sequential one-pot manner without isolating the reaction intermediates/intermediate products, such reactions can be called as domino or sequential domino one-pot reactions, respectively. The latter one would be feasible by altering the reaction conditions or by the addition of reagents to promote the subsequent reaction(s) once after the initial step(s) is/are completed. Particularly, the domino processes promoted by [Pd]-catalysis possesses a great potential for elaboration and the
development of new synthetic methods that eventually represent a new frontier to conquer in organic chemistry. These domino strategies elaborate the scope of the traditional cross-coupling chemistry due to more efficient and fast construction of molecular complexity from comparatively uncomplicated building blocks. Such transformations are also called as tandem, sequential, cascade, consecutive, iterative, zipper or one-pot (one-flask) reactions and these link several transformations together in a single synthetic operation. Domino reactions have gained wide acceptance due to increase in efficiency of a reaction by decreasing the number of synthetic transformations, the quantities of reagents and solvents used for workup procedures, column chromatography and minimization of waste and energy. Therefore, these reactions have their own significance with respect to ecological and economical aspects. ${ }^{1}$

One of the leading proponents, Prof. L. F. Tietze, Georg-August University in Gottingen, Germany, the term "domino reaction" is defined as follows: domino reaction is a process which involves two or more bond-forming transformations (usually C-C bonds) that take place under the same reaction conditions without adding additional reagents and catalysts and in which the subsequent reactions result as a consequence of the functionality formed in the previous step. ${ }^{2}$

## I. 2 BACKGROUND:

Domino organic transformations have been successfully applied in many kinds of organic reactions. Significantly, in the recent past many research groups have explored one-pot domino transition-metal-catalysis. In this regard, [Pd]-metal was found to be one amongst the transition metals employed in domino transformation. Some of the interesting examples of domino transformations mediated by [Pd]-catalyst are described as follows:

In 1994 the research group of Gerald Dyker discovered an efficient method for the synthesis of annulated pyran derivative 2 from 2-iodoanisole 1. The reaction proceeded through an unprecedented domino [Pd]-catalysis by the $\mathrm{C}-\mathrm{H}$ activation of methoxy group (Scheme I.1). ${ }^{3}$

## Scheme I. 1

Cheng and co-workers reported the synthesis of fluorenones 5 from aromatic aldoxime ethers $\mathbf{3}$ and aryl halides $\mathbf{4}$ by [Pd]-catalyzed dual C-H activation. This strategy is based on the directing-group-assisted activation of ortho aromatic C-H bonds and subsequent C-C bond formation (Scheme I.2). ${ }^{4}$

3

4

Scheme I. 2

Hu et al. discovered a novel domino Heck cyclization method involving carbopalladation and the subsequent regioselective functionalization of an unactivated C-H bond for the preparation of benzocyclo[penta- to octa-]isoindole core $\mathbf{8}$ (Scheme I.3). ${ }^{5}$

## Scheme I. 3

Mark Lautens and co-workers reported an efficient strategy for the synthesis of polycyclic heteroaromatics $\mathbf{1 0}$ from [Pd]-catalyzed domino Buchwald-Hartwig amination/direct arylation reaction from readily available gem-dibromovinyl substrates 9 (Scheme I.4). ${ }^{6}$

## Scheme I. 4

The same research group developed sequential domino ortho-arylation and a subsequent addition to the carbonyl group for the synthesis of fluorene derivatives $\mathbf{1 3}$, 18 and 19 and various phenanthrenes 15 . The reaction was performed on 2-chloroaryl ketones 12 and 14, 2-bromobenzoates 17 and 2-bromobenzaldehydes $\mathbf{3 5}$ with aryl iodides $\mathbf{1 1}$ and $\mathbf{1 6}$ as coupling partners (Scheme I.5). ${ }^{7}$

11

15 (47-70\%)

18 (46-72\%)

## Scheme I. 5

Since $\mathrm{Pd}(\mathrm{OAc})_{2} / \mathrm{Ag}_{2} \mathrm{O}$ is known to be an effective catalyst system for ortho $\mathrm{C}-\mathrm{H}$ functionalization, the research group of Cheng used [Pd]-catalysis for the reaction of acetophenone 20 as well as on aryl isopropyl ketone 21 with aryl iodides 22. The reaction gave a simple ortho-arylated product 24 with acetophenone 20 whereas phenanthrone derivative 23 was obtained as the product with aryl isopropyl ketone 21 through ortho arylation followed by intramolecular C-H activation. (Scheme I.6). ${ }^{8}$

Scheme I. 6

As a part of our research interest on domino transition-metal catalysis, ${ }^{9}$ we have disclosed an efficient and unprecedented [Pd]-catalyzed domino transformation of ortho-bromobenzyl tertiary alcohols 25 to chromenes 26 and 27, indenols 28 (Scheme I.7). ${ }^{9 \mathrm{k}, 1}$ Whereas, in the case of primary/secondary benzylic alcohols furnished the simple carbonyl products 29 as shown in Scheme I.7. Also, we have accomplished the synthesis of isobenzofurans 30 using domino [Cu]-catalyzed Sonogashira coupling of ortho-bromobenzyl tertiary alcohols $\mathbf{2 5}$ with terminal aryl-acetylenes and intramolecular anti-5-exo-dig cyclization. ${ }^{9 \mathrm{~m}}$ These structures are present in many biologically active natural products.

Scheme I. 7

Also, we successfully carried out the synthesis of functionalized diester $\mathbf{3 3}$ in a novel domino sequential one-pot process starting from readily available 2-bromobenzyl
alcohols 31. The reaction proceeds through an intermolecular oxy-Michael addition and intermolecular Heck coupling for the formation of the diester $\mathbf{3 3}$ (Scheme I.8). ${ }^{9 \mathrm{~d}}$

Scheme I. 8

Further, the method was successfully applied to the synthesis of interesting 2-benzoxepin-3(1H)-ones 34 in a sequential one-pot manner (Scheme I.9). Significantly, these 2 -benzoxepin- $3(1 H)$-ones 34 constitutes the major core of biologically active natural products. Notably, the base promoted condensation involves an interesting reaction path as follows: (i) intramolecular degradation (retro-oxy-Michael addition), (ii) intramolecular Michael addition, (iii) cyclo revision through double isomerization and (iv) finally, intramolecular condensation (Scheme I.9). ${ }^{\text {9f }}$

## Scheme I. 9

## I.3. RESULTS AND DISCUSSION:

I.3.1 Synthesis 7-Methyl-5H-dibenzo[a,c][7]annulen-5-ones via domino [Pd]catalysis:

With this background and based on our research interest on transition-metal catalyzed domino/sequential one-pot processes to develop new synthetic methods, we became interested to explore the [Pd]-catalysis on 2-bromoacetophenones 37. The inspiration behind this study is based on the efficient synthesis of chromenes 26 and 27 from ortho-bromobenzyl tertiary alcohols $\mathbf{2 5},{ }^{9 \mathrm{k}}$ which involves a domino homo coupling of two molecules that establish the bi-aryl bond in the presence of the [Pd]catalyst (Scheme I.7). Therefore, we envisioned that the [Pd]-catalyzed reaction of 2bromoacetophenones $\mathbf{3 7}$ might lead to the formation of homo bi-aryl ketones $\mathbf{3 8}$. On the other hand, the reaction might not simply stop at the homo bi-aryl ketones 38, rather could proceed further to give either phenanthroline derivative or 7-methyl-5 H -dibenzo[a,c][7]annulen-5-ones 40 via intramolecular Buchwald-Hartwig coupling or Aldol condensation, as depicted in Scheme I.10. ${ }^{\text {9e }}$

The required 2- bromoacetophenone 37 were accomplished by the addition of methyl Grignard reagent to 2-bromobenzaldehydes 35 furnished secondary alcohols 36 in very good to excellent yields (82-95\%, Table I.1). Oxidation of the secondary alcohols 36 with PCC-silica gel, gave 2-bromoacetophenone 37 in good to excellent yields (73-97\%, Table I.1). ${ }^{10}$

Table I.1: Synthesis of 2-bromoacetophenones $\mathbf{3 7 a} \mathbf{- 3 7 g}$ from corresponding 2bromobenzaldehydes 35a-35g. ${ }^{a}$

Reaction conditions: ${ }^{a}$ Yields in the parentheses are isolated yields of chromatographically pure products.

Figure I.1.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{3 6 g}$ in $\mathrm{CDCl}_{3}$

Figure I.1.2: ${ }^{13} \mathrm{C}$-NMR ( 100 MHz ) spectrum of $\mathbf{3 6 g}$ in $\mathrm{CDCl}_{3}$
The structure of secondary alcohol $\mathbf{3 6 g}$ was confirmed from the spectral data analysis. IR spectra shows the absence of the absorption band due to carbonyl stretching
of aldehyde group and the presence of broad absorption band due to OH stretching at $3416 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.1.1), the presence of two singlets at $\delta$ 7.07 and 6.92 due to two aromatic protons, presence of quartet at $\delta 5.14$ having $J=6.4$ Hz due to benzylic methine group proton, two singlets at $\delta 3.85$ and 3.83 due to six protons of two methoxy groups, presence of broad singlet at $\delta 2.23$ due to hydroxyl proton and presence of doublet at $\delta 1.41 \mathrm{ppm}$ having $J=6.4 \mathrm{~Hz}$ due to three protons of methyl group, elucidated the structure of secondary alcohol $\mathbf{3 6 g}$. In addition, the 10 signals in ${ }^{13} \mathrm{C}$-NMR spectrum (Figure I.1.2) in which four quaternary carbon resonates at $\delta 148.7,148.5,136.7$ and 111.1 were due to four aromatic carbons, the presence of two aromatic methine carbons at $\delta 115.1$ and 109.0, benzylic methine carbon resonates at $\delta 69.0$, two quartets at $\delta 56.1$ and 55.9 were due to two methoxy groups and quartet at $\delta 23.7 \mathrm{ppm}$ was due to methyl group. The presence of $\left[(\mathrm{M}+\mathrm{H})-\mathrm{H}_{2} \mathrm{O}\right]^{+}$peak at $\mathrm{m} / \mathrm{z}$ $\left[\mathrm{C}_{10} \mathrm{H}_{12}{ }^{91} \mathrm{BrO}_{2}\right]^{+}=244.9979$ in the mass spectrum further established the structure of secondary alcohol 36g.

Figure I.2.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{3 7} \mathbf{g}$ in $\mathrm{CDCl}_{3}$

Figure I.2.2: ${ }^{13} \mathrm{C}$-NMR ( 100 MHz ) spectrum of $\mathbf{3 7} \mathbf{g}$ in $\mathrm{CDCl}_{3}$

The structure of 2-bromoacetophenone $\mathbf{3 7 g}$ was confirmed from the spectral data analysis. IR spectra shows the absence of broad absorption band due to OH group stretching and the presence of absorption band due to carbonyl group stretching at 1687 $\mathrm{cm}^{-1}$. In the ${ }^{1} \mathrm{H}$-NMR spectrum (Figure I.2.1), the presence of two individual singlets at $\delta 7.11$ and 7.02 due to two aromatic protons, two singlets at $\delta 3.88$ and 3.86 due to six protons of two methoxy groups, the presence of singlet at $\delta 2.64 \mathrm{ppm}$ due to three protons of methyl group, elucidated the structure of 2-bromoacetophenone $\mathbf{3 7} \mathbf{g}$. In addition to it, 10 signals appeared in ${ }^{13} \mathrm{C}$-NMR spectrum (Figure I.2.2) in which one quaternary carbon resonates at $\delta 199.4$ was due to carbonyl carbon, four quaternary carbon resonates at $\delta 151.6,148.1,132.6$ and 111.7 were due to four aromatic carbons, the presence of two aromatic methine carbons at $\delta 116.4$ and 112.6 , two quartets at $\delta 56.2$ and 56.1 were due to two methoxy groups and a quartet at $\delta 30.3 \mathrm{ppm}$ was due to methyl group. Presence of the $[\mathrm{M}+\mathrm{H}]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{BrO}_{3}\right]^{+}=258.9950$ and $\left[\mathrm{C}_{10} \mathrm{H}_{12}{ }^{81} \mathrm{BrO}_{3}\right]^{+}=260.9943$ in the mass spectrum further established the structure of 2bromoacetophenone $\mathbf{3 7}$ g.

Now the requisite 2-bromoacetophenone $\mathbf{3 7 c}$ in hand, the 2-bromoacetophenone 37c was chosen as the model compound for the [Pd]-catalysis as depicted in Table I.2. Initially, the reaction was performed with $\mathrm{Pd}(\mathrm{OAc})_{2}(5 \mathrm{~mol} \%), \mathrm{PPh}_{3}(10 \mathrm{~mol} \%)$ and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ in toluene at $110^{\circ} \mathrm{C}$ for 26 h . Interestingly, the reaction furnished 7-methyl-5 H -dibenzo[a,c][7]annulen-5-one 40c as an exclusive product albeit in very poor yield ( $13 \%$, Table I.2, entry 1). In order to find out the best optimized reaction conditions for the synthesis of 7 -methyl-5H-dibenzo $[a, c][7]$ annulen-5-ones 40c, the reaction was explored under different set of reaction conditions and the results are summarized in the Table I.2. Thus, using DMF and dioxane as solvents slightly improved the yield of the product 40c (Table I.2, entry 2 and 3). On one hand, the reaction under different ligands $\left(\mathrm{PPh}_{3}\right.$, dppf, $\mathbf{L 1}, \mathbf{L 2}, \mathbf{L 3}$ and $\mathbf{L 4}$ ) in conjuction with the base $\mathrm{K}_{3} \mathrm{PO}_{4}$ was unsuccessful to improve the yield (Table I.2, entries 5-11) while the combination of $\mathrm{Pd}(\mathrm{OAc})_{2}$ and $\mathrm{P}(\mathrm{Cy})_{3}$ furnished the product 40c with slight increment of the yield (32\%, Table I.2, entry 12). On the other hand, the use of different catalysts in combination with either $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ or $\mathrm{K}_{3} \mathrm{PO}_{4}$ led to a less progressive yield (Table I.2, entries 13-16). There was a further drop in the yield, when the reaction was conducted with bi-aryl ligand $\mathbf{L 5}$ ( $16 \%$, Table I.2, entry 17). The yield of the product still remains poor in the presence of the ligand $\mathbf{L 5}$ with the bases $\mathrm{K}_{3} \mathrm{PO}_{4} / \mathrm{Cs}_{2} \mathrm{CO}_{3}$ (Table I.2, entries 18-21). Interestingly, the ligand L5, furnished the product in moderate yield ( $50 \%$ Table I.2, entry 22). To improve the yield further, the reaction was explored with various additives, however, there was no considerable impact on the yield of the product 40c (Table I.2, entries 23 to 32 ). Moreover, an extensive survey of bases, solvents, time and temperature by keeping the ligand $\mathbf{L 5}$ as constant failed to improve the yield of product $\mathbf{4 0 c}$ (Table I.2, entries 33 to 48) and also the reaction with $\mathrm{Pd}(\mathrm{OAc})_{2}$ without the ligand while keeping all the other parameters constant (yield $30 \%$, Table I.2, entry 49) was also not fruitful.

${ }^{a}$ All reactions were performed on $100 \mathrm{mg}(0.44 \mathrm{mmol})$ scale of $\mathbf{3 7 c}$, in 0.22 M concentration, in DMF (2 $\mathrm{mL}) .{ }^{b}$ Isolated yields of chromatographically pure products. ${ }^{c}$ No product was formed.

(Figure I.3)

Quite interestingly, from the literature search, it was found that the entire carbon core structure 7-methyl-5H-dibenzo[a,c][7]annulen-5-one 40c demonstrated biologically active natural products such as dibenzocycloheptanoids and colchicinoids (Figure I.3). ${ }^{11}$ For example, tenuifolin 41, ${ }^{11 a, b}$ shows antiproliferative activity against tumor cell line DU145. The natural reticuol 42, ${ }^{11 c, \mathrm{~d}}$ acts as the inhibitor of cytochrom P450 (CYP3 A4). Subavenoside-E 43, ${ }^{11 \mathrm{e}}$ exhibits inhibitory activity against $\alpha$ glucosidase type IV from Bacillus stearothermophilus. Similarly dihydroisosubamol 44, ${ }^{11 \mathrm{e}}$ subamol $45 .{ }^{11 \mathrm{f}, \mathrm{g}}$ and bumanol $46,{ }^{1 \mathrm{~h}}$ also reported to show biological activities. The colchicine 47 and its biphenyl structural analogues are known as allocolchicinoids. The natural cochicinoids namely allocholchicine 48, N-acetylcholchinol 49, its methylether $\mathbf{5 0}$ and its phosphate $\mathbf{5 1}$ are having greater therapeutic activities ${ }^{110-q}$ such as anti-tumour activity, in particular, the main mode of action by binding to cytoskeletal protein tubulin and disruption of the tubulin-microtubule equilibrium (in microtubulin polymerisation) in the cell, thereby causing suppression of the mitosis and cell division. methylether $\mathbf{5 1}$ has higher tubulin affinity and better stability than colchicine $\mathbf{4 7} .^{11 \mathrm{j}-\mathrm{q}}$

From literature, few reports are available for the synthesis of bi-aryl tricyclic core, which were accomplished using intermolecular Suzuki-Miyaura coupling followed by Aldol condensation protocol, ${ }^{12}$ or by intramolecular Heck reaction, ${ }^{13}$ or using bi-aryl oxidative coupling ${ }^{14}$ or Lewis acid mediated Nicholas cyclization ${ }^{15}$
reaction. It is worth mentioning that all of the above methods were based on step-wise approaches. Significantly, the present method describes about the accomplishment of such tricyclic systems in a domino one pot fashion.

Among all the above screened reaction conditions, the conditions mentioned in Table 2, entry 23 was found to be the best [i.e., $2 \mathrm{~mol} \%$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$, Xantphos $\mathbf{L 5}$ (4 $\mathrm{mol} \%$ ) and 2.0 equiv of $\mathrm{K}_{3} \mathrm{PO}_{4}$ in DMF at $150{ }^{\circ} \mathrm{C}$ ]. Although, the product 7-methyl-5 H -dibenzo[a,c][7]annulen-5-ones 40c was obtained in moderate yield $50 \%$, but for a one-
pot domino process of two individual steps (i.e., biphenyl coupling and Aldol condensation) that accounts for approximately $70 \%$ yield of each individual step. Therefore, the method is still considered to be an efficient one. Furthermore, the present method was found to be significant when compared with earlier reports which involved more than four steps with overall yield (15\%) to accomplish such structurally relevant compounds. ${ }^{16}$ Therefore, these optimized conditions (Table 2, entry 23) were applied to other 2-bromoacetophenones $\mathbf{3 7 a - 3 7 g}$ as well. Gratifyingly, the method was amenable and afforded bi-aryl cyclic products $\mathbf{4 0 a} \mathbf{- 4 0 g}$ in moderate yields (41-50\%), as shown in Table I. 3 .

Table I.3: Domino [Pd]-catalyzed synthesis of 7-methyl-5H-dibenzo[ $a, c][7]$ annulen-5ones 40a-40g from 2-bromoacetophenones $\mathbf{3 7 a - 3 7 g}$. ${ }^{a, b}$

${ }^{a}$ Reaction conditions: All the reactions were carried out with 2-bromoacetophenones $\mathbf{3 7 a} \mathbf{a} \mathbf{- 3 7 g}$ (100-150 $\mathrm{mg}, 0.30$ to 0.58 mmol ), in DMF. ${ }^{b}$ Yields in the parentheses are isolated yields of chromatographically pure products.

40 g
$1629 \mathrm{~cm}^{-1}$ due to enone carbonyl group stretching. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.5.1), the presence of five individual singlets at $\delta 7.38,7.20,7.19,7.16$ and 6.60 were due to five aromatic protons, the presence of singlet at $\delta 4.00$ was due to three protons of methoxy group, whereas the singlet at $\delta 3.98$ was due to nine protons of three methoxy groups and the presence of singlet at $\delta 2.44 \mathrm{ppm}$ was due to three protons of methyl group that elucidated the structure of 7-methyl-5 H -dibenzo $[a, c][7]$ annulen-5one $\mathbf{4 0 g}$. In addition to it, 19 signals appeared in ${ }^{13} \mathrm{C}$-NMR spectrum (Figure I.5.2) in which one quaternary carbon resonates at $\delta 191.5$ due to carbonyl carbon, nine quaternary carbon resonates at $\delta 151.4,149.0,149.0,148.1,143.9,134.9,131.8,131.4$ and 128.9 were due to nine aromatic carbons, the presence of five aromatic methine resonates carbons at $\delta 132.1,113.8,111.8,109.6$ and 109.5 , four quartets at $\delta 56.1$ (2C), 56.0 and 55.9 were due to four methoxy groups and methyl group carbon resonates at $\delta 24.9 \mathrm{ppm}$. The presence of the $[\mathrm{M}+\mathrm{Na}]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{NaO}_{5}\right]^{+}=363.1201 \mathrm{in}$ the mass spectrum further established the structure of 7-methyl-5 H dibenzo[ $a, c]$ [7]annulen-5-one 40g.

Further to the spectroscopic evidence in confirming the structure of the 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones $40 \mathrm{a}-40 \mathrm{~g}$, the complete structure was unambiguously confirmed by the single crystal X-ray diffraction analysis of $\mathbf{4 0 g}$ (Figure I.6).

Figure I. 6 (40g)

After the successful synthesis of 7-methyl-5 H -dibenzo[a,c][7]annulen-5-ones 40 starting from 2-bromoacetophenones 37, this method was implemented on another
system such as 1-(2-bromophenyl)propan-1-one 52. However, the reaction was unsuccessful to deliver the desired product 53, as no clear spot was seen on TLC (Scheme I.11). This might have been due to the availability of $\beta$-hydrogen to the feasible five membered palladacycle intermediate, which may collapse through intramolecular syn- $\beta$ elimination, instead of intermolecular bi-aryl coupling.

Scheme I. 11

The plausible mechanism for the formation of 7-methyl-5H-dibenzo[a,c][7]annulen-5-one 40 can be explained as depicted in Scheme I.12. The first step is an oxidative insertion of $\mathrm{Pd}(0)$-catalyst into the $\mathrm{Ar}-\mathrm{Br}$ bond of $\mathbf{3 7 a}$ resulting in the formation of $\mathrm{Pd}($ II $)$-intermediate 54. It would then be inserted into $\mathrm{sp}^{3} \mathrm{C}$ - H bond of the ketone and result in a five membered Pd(IV)-intermediate 55. The intermediate $\mathbf{5 5}$ undergoes reductive elimination and would result in the formation of $\operatorname{Pd}(\mathrm{II})$ intermediate 56. Now the key five membered palladacycle 56 combines with a second molecule 37a and generates Pd(IV)-complex 57. ${ }^{17} \mathrm{Bi}$-aryl bond formation would lead to acyclic bi-aryl $\mathrm{Pd}(\mathrm{II})$-intermediate that may undergo intramolecular nucleophilic addition by $\mathrm{Pd}(\mathrm{II})$-species to keto group of second aromatic ring and result in $\mathrm{Pd}(\mathrm{II})-$ species 58. Expulsion of [Pd]-complex $\mathbf{5 8}^{18}$ by base may produce tertiaryalkoxide $\mathbf{5 9}$ and $\operatorname{Pd}(I I)$-species. Finally, the catalytic cycle completes the transformation of tertiaryalkoxide 59 into product 40a by base induced dehydration. The so formed $\mathrm{Pd}(\mathrm{II})$-catalyst during the course of a catalytic cycle may regenerate $\mathrm{Pd}(0)$ or the $\mathrm{Pd}(\mathrm{II})-$ catalyst itself might further be able to catalyze the reaction. Since Ar-Br bond of electron deficient 1-(2-bromophenyl)ethanones $\mathbf{3 7} \mathbf{c}$ is relatively more reactive than the simple $\mathrm{Ar}-\mathrm{Br}$ one. This has been proved by performing the reaction only with $\mathrm{Pd}(\mathrm{OAc})_{2}$
without using the ligand while keeping all the other parameters constant (30\%, Table I.2, entry 49).

## Scheme I. 12

## I.3.2 Synthesis of $\alpha$-aryl ketones via [Pd]-catalysis:

With this background of an unprecedented one-pot domino [Pd]-catalysis for the synthesis of 7-methyl-5H-dibenzo $[a, c][7]$ annulen-5-ones 40, ${ }^{9 \mathrm{e}}$ we have anticipated the formation of tricyclic ketones $\mathbf{6 3}$ corresponding aromatic motifs by performing [Pd]catalysis in the presence of external haloarene $60 \mathrm{~g} / 61 \mathrm{e}$. The formation of tricyclic products 63 was expected to be feasible via heterobiaryl formation followed by intramolecular Buchwald-Hartwig cyclization sequence. Though, initially, the reaction was performed using above optimized reaction conditions (Table I.2, entry 23) in the presence of phenyl bromide 60 g as well as the more reactive iodoarene 61 e as external haloarenes. The reaction however was not clean and did not furnish the expected products $63 \mathrm{~g} / 63 \mathrm{e}$ [i.e., neither the starting material 37 c nor the product was isolated]. Nevertheless, after screening the reaction under different set of conditions, it was observed that the combination of $\operatorname{Pd}(\mathrm{OAc})_{2}(2 \mathrm{~mol} \%) /$ Xantphos ( $5 \mathrm{~mol} \%$ ) and the base ${ }^{t} \mathrm{BuOK}$ in toluene at $80^{\circ} \mathrm{C}$ for 12 h was successful, but, the reaction was impeded after $\alpha-\mathrm{C}-\mathrm{H}$ activation of the ketone and gave exclusively the simple $\alpha$-arylated product 62 e
instead of the expected product 63e. It is worth mentioning that the above set of reaction conditions was successful in delivering the products 62e only with the more reactive iodarene 61e but not with the bromo one $\mathbf{6 0 g}$ (Scheme I.13). ${ }^{9 \mathrm{j}}$

Scheme I. 13

The transition-metal mediated $\alpha$-arylation for the synthesis of corresponding $\alpha$ arylated products identified as an important transformation, as applied in a variety of applications is a key step for synthesis of various intermediates present in many natural and unnatural products. ${ }^{19}$ Many traditional methods are available for the synthesis of $\alpha$ aryl ketones. Those are arduous due to different arylating reagents that were developed for the synthesis of $\alpha$-aryl ketones and these reagents are used as stochiometric ratio using main group enol ethers ${ }^{20}$ or bismuth/lead reagents. ${ }^{21}$ Due to these drawbacks, transition-metal catalyzed direct arylation methods have gained more importance for the synthesis of $\alpha$-aryl products.

It was an unprecedented discovery of $\alpha$-arylation by Buchwald and Hartwig in 1997. Buchwald carried out $\mathrm{Pd}_{2}(\mathrm{dba})_{3} /$ Tol-BINAP catalyzed coupling of sodium
alkoxides (generated in-situ by the reaction of alcohol 64 with NaH with electrondeficient aryl bromides $\mathbf{6 5}$ to give arylethers. Interestingly, unexpected $\alpha$-arylated product 67 was observed with $2 \%$ yield. This was the foundation for the discovery of $\alpha$-arylation of ketones by Buchwald (Scheme I.14). ${ }^{22}$

Scheme I. 14

The basis of the development of $\alpha$-arylation of carbonyl compounds was laid when Hartwig conducted the amination reaction in acetone, and interestingly it led to the formation of $\alpha$-arylated product as a by-product. ${ }^{23}$

Subsequently, the research groups of Buchwald and Hartwig developed various methods for the $\alpha$-arylation of ketones. ${ }^{24}$ Recently, $\alpha$-arylation had also been reported using 1-bromo-2-iodobenzenes as coupling partners by Willis et al. ${ }^{25}$ The present work describes $\alpha$-arylation, the bromo-substituent is part of a relatively more reactive 2 bromoacetophenones 37 (Scheme I.13). Notably, after several screenings, we realized that our above reported conditions ${ }^{9 e}$ for longer reaction time were not that much applicable for other systems. In general, in many instances bi- $\alpha$-arylation products along with a small amount of other by-products were also formed. This may be due to the fact that the slightly excess amount (1.1 equiv) of iodoarenes with respect to 2bromoacetophenones 37 would tend to involve in second $\alpha$-arylation. Thus, various set of conditions were explored to identify optimized reaction conditions. To our delight, the reaction conditions reported by Buchwald et al. ${ }^{24 \mathrm{a}}$ were found to be suitable for our systems (i.e., with 1 equiv of iodo-arene $\mathbf{6 1 e}$ and 1.1 equiv of 2-bromoacetophenone 37). Further, these optimized conditions were found to be general and amenable to
various iodoarenes containing electron withdrawing and electron donating substituents on the aromatic ring. The reaction was completed in shorter reaction time (i.e., typically 45 min to 3 h ) and furnished the $\alpha$-arylation products 62ag-62gf in very good yields as shown in Table I.4. ${ }^{9 \mathrm{j}}$

Table I.4: [Pd]-Catalyzed synthesis of 1-(2-bromophenyl)-2-phenylethanone 63ag-63gf from 2-bromoacetophenones $\mathbf{3 7 a - 3 7 g}$ with iodoarene 61a-61f. ${ }^{a, b, c}$

${ }^{a}$ All reactions were carried out on 0.5 mmol scale of iodoarenes of 61a-61f in 4 mL of toluene ( 0.12 M ). ${ }^{b}$ Isolated yields of chromatographically pure products. ${ }^{c}$ For compounds 62ag-62gf the first alphabet letter refers to the 2 -bromoacetophenes $\mathbf{3 7 a}-\mathbf{3 7} \mathrm{g}$ whereas the second letter indicates the aromatic ring coming from iodoarenes 61a-61f.

Figure I.7.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{6 2 g d}$ in $\mathrm{CDCl}_{3}$

Figure I.7.2: ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})$ spectrum of $\mathbf{6 2 g d}$ in $\mathrm{CDCl}_{3}$

The structure of 1-(2-bromophenyl)-2-phenylethanone 62gd was confirmed by IR and NMR data analysis. IR spectra show the presence of the absorption band due to carbonyl stretching at $1694 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.7.1), the presence
of two singlets at $\delta 7.10$ and $\delta 7.03$ due to two aromatic protons, two doublets at $\delta 6.88$ having $J=8.8 \mathrm{~Hz}$ and $\delta 6.62$ having $J=8.8 \mathrm{~Hz}$ due to two aromatic protons, the presence of singlet at $\delta 4.20$ due to methylene group and the presence of three singlets at $\delta$ $3.89(3 \mathrm{H}), 3.85(3 \mathrm{H})$ and $3.83(9 \mathrm{H}) \mathrm{ppm}$ due to fifteen protons of five methoxy groups, elucidated the structure of 1-(2-bromophenyl)-2-phenylethanone 62gd. In addition to it, 19 signals appeared in ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Figure I. 7.2) in which carbonyl carbon resonates at $\delta 200.1$, eight aromatic quaternary carbons resonates at $\delta 153.2,151.7,151.2$, $148.0,142.2,132.6,120.9$, and 111.1, the presence of four aromatic methine carbons at $\delta$ 125.1, 116.4, 112.5, and 107.2, five quartets at $\delta 60.8,60.7,56.3,56.1$ and 56.0 were due to methoxy groups, methylene group carbon resonates at $\delta 43.3 \mathrm{ppm}$. The presence of $[\mathrm{M}+\mathrm{H}]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{BrO}_{6}\right]^{+}=425.0605$ in the mass spectrum further established the structure of 1-(2-bromophenyl)-2-phenylethanone 62gd.

## I.3.3 Synthesis of bi-aryls via domino [Pd]-catalysis:

After the successful accomplishment of 7-methyl-5H-dibenzo[a,c][7]annulen-5ones $\mathbf{4 1},{ }^{9 \mathrm{e}}$ and the synthesis of $\alpha$-arylation products $\mathbf{6 2},{ }^{9 \mathrm{j}}$ through [Pd]-catalysis, we further became interested to check the outcome of 2-bromoarylisopropyl ketones 69 in the presence of [Pd]-catalyst. The requisite 1-(2-bromophenyl)-2-methylpropan-1-one 69 derivatives were readily obtained in two reaction steps starting from 2bromobenzaldehydes 35. Thus, the addition of isopropyl Grignard reagent to the corresponding 2-bromobenzaldehydes 35a-35h gave secondary alcohols 68a-68h in good to very good yields ( $70-86 \%$, Table 5). Oxidation of the secondary alcohols 69 with PCC furnished 1-(2-bromophenyl)-2-methylpropan-1-one 69a-69h in excellent yields ( $93-99 \%$, Table 5), as summarized in Table I.5. ${ }^{9 \mathrm{i}}$

Table I.5: Synthesis of 1-(2-bromophenyl)-2-methylpropan-1-one 69a-69h from corresponding 2-bromobenzaldehydes $\mathbf{3 5 a - 3 5 h}$. ${ }^{a}$

${ }^{a}$ Reaction conditions: Yields in the parentheses are isolated yields of chromatographically pure products.

68a

Figure I.8.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{6 8 a}$ in $\mathrm{CDCl}_{3}$

Figure I.8.2: ${ }^{13} \mathrm{C}$-NMR ( 100 MHz ) spectrum of $\mathbf{6 8 a}$ in $\mathrm{CDCl}_{3}$
The structure of secondary alcohol 68a was confirmed by IR and NMR data analysis. IR spectra shows the absence of the absorption band due to carbonyl stretching of aldehyde group and the presence of broad absorption band due to OH stretching at $3397 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$-NMR spectrum (Figure I.8.1), the presence of doublet of a doublet
at $\delta 7.51$ having $J=7.8$ and 1.0 Hz due to one aromatic proton, doublet of a doublet at $\delta 7.48$ having $J=7.8$ and 2.0 Hz due to one aromatic proton, doublet of a doublet of doublet at $\delta 7.31$ having $J=8.8,7.3$ and 1.0 Hz due to one aromatic proton, doublet of a doublet of doublets at $\delta 7.11$ having $J=8.8,7.3$ and 2.0 Hz due to one aromatic proton, presence of doublet at $\delta 4.86$ having $J=5.9 \mathrm{~Hz}$ due to benzylic proton, septet of doublet at $\delta 2.05$ having $J=5.9$ and 1.0 Hz due to one proton, br. s, at $\delta 1.97 \mathrm{ppm}$ due to hydroxy proton, the presence of two doublets at $\delta 0.95$ and 0.94 ppm having $J=6.4$ and 6.4 Hz due to two methyl groups, elucidated the structure of secondary alcohols 68a. In addition to it, 10 signals appeared in ${ }^{13} \mathrm{C}$-NMR spectrum (Figure I.8.2) in which two quaternary carbon resonates at $\delta 142.8$ and 122.6 were due to two aromatic carbons, the presence of four aromatic methine carbons at $\delta 132.6,128.6,128.2$ and 127.4, benzylic carbon resonates at $\delta 77.5$, the presence of $\delta 33.9$ was due to $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ group and two methyl carbons resonates at $\delta 19.4$ and 16.7 ppm . The presence of $\left[(\mathrm{M}+\mathrm{H})-\mathrm{H}_{2} \mathrm{O}\right]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{Br}\right]^{+}=211.0117$ in the mass spectrum further established the structure of secondary alcohols 68a.

Chloroform-d

69a

Figure I.9.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{6 9} \mathbf{a}$ in $\mathrm{CDCl}_{3}$

Figure I.9.2: ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})$ spectrum of $\mathbf{6 9}$ a in $\mathrm{CDCl}_{3}$

The structure of 1-(2-bromophenyl)-2-methylpropan-1-one 69a was confirmed by IR and NMR data analysis. IR spectra shows the absence of the absorption band due to stretching of OH group and the presence of absorption band due to carbonyl stretching at $1700 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.9.1), doublet of a doublet at $\delta 7.59$ having $J=7.8$ and 1.5 Hz due to one aromatic proton, doublet of a doublet of doublet at $\delta 7.36$ having $J=9.3,7.8$ and 1.5 Hz due to one aromatic proton, doublet of a doublet at $\delta 7.29$ having $J=7.8$ and 1.5 Hz due to one aromatic proton, doublet of a doublet of doublet at $\delta 7.27$ having $J=9.3,7.8$ and 1.5 Hz due to one aromatic proton, presence of septet at $\delta 3.32$ having $J=6.8 \mathrm{~Hz}$ due to $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ group, and doublet at $\delta$ 1.20 ppm having $J=6.8 \mathrm{~Hz}$ due to six protons of two methyl groups, elucidated the structure of 1-(2-bromophenyl)-2-methylpropan-1-one 69a. In addition to it, 10 signals appeared in ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Figure I.9.2) in which quaternary carbon resonates at $\delta 208.7$ were due to carbonyl carbon, two quaternary carbon resonates at $\delta 142.0$ and 118.6 were due to two aromatic carbons, the presence of four aromatic methine carbons at $\delta 133.3,131.0,128.1$ and 127.2 , the presence of $\delta 40.1$ was due to $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$, two
methyl groups carbon resonates $\delta 18.1$ (2C) ppm. The presence of $[\mathrm{M}+\mathrm{H}]^{+}$peak at $\mathrm{m} / \mathrm{z}$ $\left[\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{BrO}\right]^{+}=227.0065$ in the mass spectrum further established the structure of 1-(2-bromophenyl)-2-methylpropan-1-one 69a.

Now the requisite 1-(2-bromophenyl)-2-methylpropan-1-ones 69 in hand, post which the $[\mathrm{Pd}]$-catalysis was explored. However, the reaction was unsuccessful under the above optimized conditions (Table I.2, entry 23) that were applied on 2bromoacetophenone $37 .{ }^{9 e}$ Quite surprisingly, slight modification of the reaction conditions (i.e., with base $\mathrm{K}_{2} \mathrm{CO}_{3}$ and solvent toluene), showed a dramatic effect and furnished only the bi-aryl product 70 in a controlled fashion, in excellent yield ( $97 \%$, Table I.6). The formation of bi-aryl product 70 can be justified on the basis of mild base $\mathrm{K}_{2} \mathrm{CO}_{3}$ which would not be strong enough to deprotonate the acidic $\alpha$-hydrogen of isopropyl ketone 69, hence, it was assumed that a simple $\mathrm{sp}^{3} \mathrm{C}-\mathrm{H}$ activation would be feasible to yield the five-membered palladacycle by the initially formed aryl Pd (II)species. It may be true that the five-membered palladacycle would proceed through a tight transition state and might have sufficient longer life time so as to combine with the second molecule to establish the bi-aryl bond. This five membered palladacycle would in turn couple with the second molecule 69 to form the bi-aryl bond and finally may undergo rapid reductive syn- $\beta$-elimination (due to the availability of $\beta$-hdrogens) than the intramolecular Aldol reaction (for details, see; Scheme I.15). Notably, there were clear cut distinctions between the reaction conditions of 2-bromoacetophenones 37 and 2-bromoisopropylphenones 69. The former one possessing relatively more acidic hydrogens than that of the isopropyl ketones 70 and the strong base $\mathrm{K}_{3} \mathrm{PO}_{4}$ was suitable for deprotonation of 2-bromoacetophenones 37 , to facilitate the formation of five membered palladacycle followed by bi-aryl coupling and then intramolecular aldol condensation (due to non-availability of $\beta$-hydrogens) to furnish the 7-Methyl-5H dibenzo[ $a, c][7]$ annulen-5-ones $41 .{ }^{9 e}$ Whereas in the case of 2-bromoisopropylphenones 69, definitely, the formation of enolate would not be feasible, however, the requisite five-membered palladacycle would be resulted only by direct $\mathrm{sp}^{3} \mathrm{C}-\mathrm{H}$ activation after
the initial formation of aryl-Pd-species. With these conditions in hand, for the formation of bi-aryl product 70, to check the scope and limitations of the method, the [Pd]catalysis was explored on other systems of 1-(2-Bromophenyl)-2-methylpropan-1-ones 69. Agreeably, it was observed that the optimized conditions are amenable to other 1-(2-bromophenyl)-2-methylpropan-1-ones 69 and furnished bi-aryl products 70 in very good to excellent yields (Table I.6). However, in case of $\mathbf{6 9 h}$, the product $\mathbf{7 0 h}$ was formed in moderate yield (Table I.6). This can be justified due to steric hindrance of the di-ortho-substituents on the aromatic rings of the bi-aryl product 70h. ${ }^{9 i}$

Table I.6: Synthesis of bi-aryls 70a-70h from 1-(2-bromophenyl)-2-methylpropan-1ones

69a-69h.

${ }^{a}$ Reaction conditions: All the reactions carried out with $\mathbf{6 9 a - 6 9 h}(100 \mathrm{mg}, 0.27$ to 0.44 mmol$)$, in toluene. ${ }^{b}$ Isolated yields are chromatographically pure products. ${ }^{c}$ Isolated yield of chromatographically pure product based on the starting material recovery.

Figure I.10.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{7 0 a}$ in $\mathrm{CDCl}_{3}$

Figure I.10.2: ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})$ spectrum of 70a in $\mathrm{CDCl}_{3}$

The structure of bi-aryl 70a was confirmed by IR and NMR data analysis. IR spectra shows the presence of absorption band due to carbonyl stretching at $1687 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}$-NMR spectrum (Figure I.10.1) a multiplet in the region of $\delta 7.55-7.47$ due to one aromatic proton, doublet of a doublet at $\delta 7.44$ having $J=7.3$ and 1.5 Hz due to one aromatic proton, doublet of a doublet at $\delta 7.40$ having $J=7.3$ and 2.0 Hz due to one aromatic proton, doublet of a doublet at $\delta 7.39$ having $J=5.4$ and 2.0 Hz due to one aromatic proton, a multiplet in the region of $\delta 7.38-7.30$ due to two aromatic protons, doublet of a doublet at $\delta 7.14$ having $J=7.3$ and 2.0 Hz due to one aromatic proton, a multiplet in the region of $\delta 7.12-7.06$ due to one aromatic proton, presence of two individual singlets at $\delta 5.85$ and 5.74 due to olefinic methylene protons, septet at $\delta 2.85$ having $J=6.8 \mathrm{~Hz}$ due to $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$, singlet at $\delta 1.84$ due to three protons of methyl group and br. s, at $\delta 0.94 \mathrm{ppm}$ which accounts for six protons of two methyl groups, elucidated the structure of bi-aryl 70a. In addition to it, 18 signals appeared in ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Figure I.10.2) in which two quaternary carbon resonates at $\delta 210.5$ and 199.7 due to two carbonyl carbons, five quaternary carbon resonates at $\delta 145.1,140.0,139.6$, 138.9 and 138.7 were due to four aromatic carbons and one for olefinic carbon, presence of eight aromatic methine carbons resonates at $\delta 130.8,130.5,130.0$, 129.7, 129.7, 128.3, 127.5 and 126.9, olefinic methylene carbon resonates at $\delta$ 129.6, the presence of $\delta 38.9$ due to $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ group and three methyl group resonates at $\delta 17.4 \mathrm{ppm}$. The presence of $[\mathrm{M}+\mathrm{Na}]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{NaO}_{2}\right]^{+}=315.1361$ in the mass spectrum further established the structure of bi-aryl 70a.

In addition to the NMR and other spectroscopic studies for structural elucidation, the structure of bi-aryl 70a-70h was further unambiguously confirmed by the single crystal X-ray diffraction analysis of 70a (Figure I.11).

(Figure I.11) (70a)

Interestingly, the bi-aryl core constitutes a privileged structural motif that is found in approximately $4.3 \%$ of all biologically active natural products (Figure I.12). ${ }^{26-}$ ${ }^{38}$ For example, (+)-isoschizandrin 71, ${ }^{26}$ a lignin from schizandra chinesis, has been used in the chinese traditional medicines as an antitussive, steganone $\mathbf{7 2},{ }^{27}$ was found to inhibit tubulin polymerization both in-vitro and in-vivo. The derivatives of valoneaic acid $\mathbf{7 3},{ }^{28}$ are widely distributed in many kinds of higher plants possessing interesting biological activities such as antioxidant and anti-tumor properties. The bi-aryl natural product mastigophorene (A) 74 exhibits nerve-growth stimulating activity. ${ }^{29}$ The natural korupensamine A 75 shows good antimalarial activity in-vitro and in-vivo, ${ }^{30}$ whereas the binaphthalene gossypol 76, ${ }^{31}$ possesses antispermatogenic, ${ }^{32}$ antitumor, ${ }^{33}$ and antimalarial ${ }^{34}$ activities and agrochemical specialties and also the valsartan 77, ${ }^{35}$ lotarsan 78, ${ }^{36}$ buflavine 79, ${ }^{37}$ exhibits interesting biological activity. Due to their physical properties polyaromatics are widely used as organic conductors or semiconductors. Some of the bi-aryls which contain di- or tri-aromatic rings are often used as selective ligands for asymmetric catalysis, when atropisomerism is possible. ${ }^{38}$

The transition-metal catalyzed cross-coupling reactions are powerful synthetic tools for preparation of these bi-aryl scaffolds. Numerous traditional methods exist for the synthesis of bi-aryls like Kumada coupling (using arylmagnesium halides), Stille (using organotin reagents), Suzuki (using organoboron derivatives), Suzuki-Miyaura (using organoboron derivatives), Negishi (using organozinc reagent) and Hiyama (using organosilanes). ${ }^{39}$ Despite their remarkable effectiveness, these methods suffer from several key drawbacks such as the requirement of large amount of expensive and toxic
organometallic reagent in stoichiometric amount in addition to the transition-metal catalyst. Therefore, these methods are not considered as efficient ones with respect to economic and environmental point of view. Therefore, direct arylation methods are gaining more importance for the synthesis of bi-aryls. In this regard, a good number of methods have been developed for the synthesis of bi-aryl scaffolds using simple [Pd]catalyst. ${ }^{40}$

81g

Figure I.14.2: ${ }^{13} \mathrm{C}$-NMR ( 100 MHz ) spectrum of $\mathbf{8 1 g}$ in $\mathrm{CDCl}_{3}$

The structure of (2-bromophenyl) (cyclohexyl) methanone 81g was confirmed by IR and NMR data analysis. IR spectra shows the absence of the broad absorption band, due to stretching of OH group and the presence of absorption band due to carbonyl stretching at $1688 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.14.1), the presence of two singlets at $\delta 7.00$ and 6.83 were due to two aromatic protons, two singlets at $\delta$ 3.88 and 3.86 were due to six protons of two methoxy groups, the presence of triplet of triplets at $\delta 3.01$ having $J=11.2 \mathrm{~Hz}$ was due to one proton and a multiplet at $\delta 2.10-1.10$ ppm was due to cyclohexyl ten protons, elucidated the structure of (2bromophenyl)(cyclohexyl) methanone $\mathbf{8 1 g}$. In addition to it, 13 signals appeared in ${ }^{13} \mathrm{C}$ NMR spectrum (Figure I.14.2) in which one quaternary carbon resonates at $\delta 207.0$ was due to carbonyl carbon, the presence of four quaternary carbon resonates at $\delta 150.8$, $148.2,133.7$ and 110.2 were due to four aromatic carbons, the presence of two aromatic methine carbons at $\delta 116.0$ and 110.2, two methoxy group carbons resonates at $\delta 56.2$ and 56.1 , the presence of $\delta 49.4$ was due to $\mathrm{Cy}-\mathrm{CH}$ group and cyclohexyl five carbon resonates at signals at $\delta 28.7(2 \mathrm{C}), 25.8,25.7(2 \mathrm{C}) \mathrm{ppm}$. The presence of $[\mathrm{M}+\mathrm{H}]^{+}$peak at
$\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{15} \mathrm{H}_{20}{ }^{79} \mathrm{BrO}_{3}\right]^{+}=327.0592$ in the mass spectrum further established the structure of (2-bromophenyl) (cyclohexyl) methanone 81g.

Finally, [Pd]-catalysis was applied on (2-bromophenyl)(cyclohexyl)methanones 81g. Interestingly, the method was also quite successful on 81a-81h and furnished 82a82h in very good yields as shown in Table I.8. Once again, the steric effect due to ortho-substituents was observed for 81 h which lowered the yield of the product 81 h when compared with the other substrates. ${ }^{9 i}$

Table I. 8 Synthesis of bi-aryls $\mathbf{8 2 a} \mathbf{a}$-82h from (2-bromophenyl)(cyclohexyl)methanones 81a-81h.

${ }^{a}$ Reaction conditions: All the reactions were carried out with $\mathbf{8 1 a - 8 1 h}(100 \mathrm{mg}, 0.25$ to 0.37 mmol$)$ in toluene. ${ }^{b}$ Isolated yields are chromatographically pure products. ${ }^{c}$ Isolated yield of chromatographically pure product based on the starting material recovery.

Figure I.15.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of $\mathbf{8 2 g}$ in $\mathrm{CDCl}_{3}$

Figure I.15.2: ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})$ spectrum of $\mathbf{8 2 g}$ in $\mathrm{CDCl}_{3}$

The structure of bi-aryl $\mathbf{8 2 g}$ was confirmed by IR and NMR data analysis. IR spectra show the presence of the absorption band at $1673 \mathrm{~cm}^{-1}$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure I.15.1), the presence of four individual singlets at $\delta 7.03,6.95,6.63$ and 6.60 were due to four aromatic protons, a multiplet in the region at $\delta 6.55-6.45$ was due to one olefinic proton, four singlets at $\delta 3.91,3.90,3.85$ and 3.82 were due to twelve protons of four methoxy groups, presence of triplet of triplets at $\delta 2.4$ having $J=11.2$ and 3.4 Hz due $\mathrm{Cy}-\mathrm{CH}$ group and a multiplet in the region at $\delta 2.30-0.50$ was due to eighteen cyclohexyl protons, elucidated the structure of bi-aryl $\mathbf{8 2 g}$. In addition to it, 29 signals appeared in ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Figure I.15.2) in which two quaternary carbon resonates at $\delta 208.0$ and 199.0 were due to two carbonyl carbons, nine quaternary carbon resonates at $\delta 150.2,149.7,148.0,147.9,140.2,133.4,133.0,132.3$ and 131.8, whereas eight accounts for aromatic carbons and one accounts for olefinic carbon, the presence of five methine carbons at $\delta 144.1,113.6,113.1,111.9$ and 111.9 were due to four aromatic methine carbons and one for olefinic methine carbon, four methoxy group carbons resonates at $\delta 56.1$ for 2C, 56.0 and 55.9 , the presence of $\delta 48.9$ due to CyCH group, and two cylohexyl group nine carbon resonates at $\delta$ 29.7, 29.1, $26.0,25.8,25.7,25.6,23.4,21.8$ and 21.5 ppm . The presence of $[\mathrm{M}+\mathrm{H}]^{+}$peak at $\mathrm{m} / \mathrm{z}$ $\left[\mathrm{C}_{30} \mathrm{H}_{37} \mathrm{O}_{6}\right]^{+}=493.2587$ in the mass spectrum further established the structure of bi-aryl 82g.

The plausible mechanistic pathways (path a and path b) for the formation of 70a were described in Scheme I.15. Initially, oxidative insertion of $\operatorname{Pd}(0)$-catalyst (i.e., via path a) would lead to aryl-palladium(II) species $\mathbf{8 3},{ }^{14}$ and then intramolecular $s p^{3} \mathrm{C}$ H activation bond furnishes the five-membered palladacycle $\mathbf{8 4}$ [as discussed earlier, in the present case, the mild base $\mathrm{K}_{2} \mathrm{CO}_{3}$ would not be strong enough to deprotonate $\alpha$ hydrogen of isopropyl ketone, therefore, it is assumed that direct $s p^{3} \mathrm{C}-\mathrm{H}$ activation would be triggered by $\mathrm{Pd}(\mathrm{II})$ species of intermediate $\mathbf{8 4}$ of the ketone and concomitant elimination of HBr might lead to the formation of a five-membered palladacycle 84. Then the key palladacycle 84 combines with a second molecule of 69 a and an
instantaneous bi-aryl bond formation would yield $\mathrm{Pd}(\mathrm{II}){ }^{41}$ complex 85. Finally, expulsion of Pd -species through reductive syn- $\beta$-elimination generates the bi-aryl product 70a. On the other hand, generation of five membered palladacycle $\mathbf{8 6}$ could also be feasible through chelation of aryl Pd(II)-species with the oxygen of ketone moiety (i.e., via path b). The second molecule of 69a could couple with the palladacycle 86, thus furnishing the bi-aryl intermediate 87 , which could be converted to intermediate 85 upon isomerization that has been formed via path a.

Scheme I. 15

## I.4. CONCLUSIONS:

In conclusion, we have developed an unprecedented and novel domino [Pd]catalysis for the synthesis of 7-methyl-5H-dibenzo[a,c][7]annulen-5-ones. Significantly, these tricyclic systems constitute the major core of biologically active natural products. Also, we have demonstrated a [Pd]-catalyzed selective $\alpha$-arylation of 2-
bromoacetophenones, for the synthesis of 1-(2-bromophenyl)-2-phenylethanones. External iodoarenes were identified as suitable coupling partners than bromoarenes. In addition, quite surprisingly, [Pd]-catalysis of 1-(2-bromophenyl)isopropyl ketones gave bi-aryls through homo-coupling. Delightfully, these bi-aryls scaffolds are present in many biologically active bi-aryl based natural products. This method is competent and proficient to deliver the bi-aryls with dense functionalities on the aromatic moieties. Overall, it was realized that the change in the alkyl group and slight modification in the reaction conditions altered the fate of the reaction.

Scheme I. 16

## I. 5 EXPERIMENTAL SECTION:

## General:

IR spectra were recorded on a Bruker Tensor 37 (FT-IR) spectrophotometer. ${ }^{1} \mathrm{H}-$ NMR spectra were recorded on Bruker Avance $400(400 \mathrm{MHz})$ spectrometer at 295 K in $\mathrm{CDCl}_{3}$; chemical shifts ( $\delta$ in ppm) and coupling constants ( $J$ in Hz) are reported in standard fashion with reference to either internal standard tetramethylsilane (TMS) ( $\delta_{\mathrm{H}}$ $=0.00 \mathrm{ppm})$ or $\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}}=7.25 \mathrm{ppm}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on Bruker Avance $400(100 \mathrm{MHz})$ spectrometer at RT in $\mathrm{CDCl}_{3}$; chemical shifts ( $\delta$ in ppm) are reported relative to $\mathrm{CHCl}_{3}$ [ $\delta_{\mathrm{C}}=77.00 \mathrm{ppm}$ (central line of triplet)]. In the ${ }^{13} \mathrm{C}-\mathrm{NMR}$, the nature of carbons $\left(\mathrm{C}, \mathrm{CH}, \mathrm{CH}_{2}\right.$ and $\left.\mathrm{CH}_{3}\right)$ was determined by recording the DEPT135 spectra, and is given in parentheses and noted as $\mathrm{s}=\operatorname{singlet}$ (for C ), $\mathrm{d}=\operatorname{doublet}$ (for $\mathrm{CH}), \mathrm{t}=$ triplet $\left(\right.$ for $\left.\mathrm{CH}_{2}\right)$ and $\mathrm{q}=$ quartet $\left(\right.$ for $\left.\mathrm{CH}_{3}\right)$. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$, the following abbreviations were used throughout: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, qui $=$ quintet, $\mathrm{m}=$ multiplet and br. $\mathrm{s}=$ broad singlet, septd $=$ septet of doublets. The assignment of signals was confirmed by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ CPD and DEPT spectra. Highresolution mass spectra (HR-MS) were recorded on an Agilent 6538 UHD Q-TOF using multimode source. X-ray crystal structure data was measured using the Oxford Super Nova instrument. All small scale dry reactions were carried out using the standard syringe-septum technique. Reactions were monitored by TLC on silica gel using a mixture of petroleum ether and ethyl acetate as eluents. Reactions were generally run under an argon or nitrogen atmosphere. All solvents were distilled to prior use; petroleum ether with a boiling range of 60 to $80^{\circ} \mathrm{C}$, diethyl ether, dichloromethane (DCM), ethyl acetate, toluene (with purity 99\%), DMF (with purity 99\%), DMA (with purity $99 \%$ ), THF (with purity $99 \%$ ), acetonitrile (with purity $99.9 \%$ ), purchased from locally available commercial sources were used. All aromatic aldehydes (with purity $98 \%$ ), bromine (with purity $99 \%$ ), iodine (with purity $99 \%$ ), methyl iodide (with purity $99 \%$ ), ethyl bromide (with purity $99 \%$ ), isopropyl bromide (with purity $99 \%$ ), magnesium metal, $4 \AA$ molecular sieves, sodium metal, silica gel ( $60-120 \mathrm{mesh}$ ) and ${ }^{t}$ BuOK (with purity $98 \%$ ) purchased from locally available commercial sources were
used. Palladium(II) acetate (with purity 98\%), 4,5-Bis(diphenylphosphino)-9,9dimethylxanthene (Xantphos) (with purity 97\%), 2-dicyclohexylphosphino-2'-(N,Ndimethylamino)biphenyl (DavePhos) (with purity 99\%), (2biphenyl)dicyclohexylphosphine (cyclohexyl JohnPhos) (with purity 97\%), (2-biphenyl)di-tert-butylphosphine (JohnPhos) (with purity 97\%), 1,1'bis(diphenylphosphino)ferrocene (dppf) (with purity 97\%), 2-di-tert-butylphosphino-2',4',6'-triisopropylbiphenyl (tert-Butyl XPhos) (with purity 97\%), triphenylphosphine $\left(\mathrm{PPh}_{3}\right)$ (with purity $99 \%$ ), $\mathrm{Pd}(\mathrm{dppf}) \mathrm{Cl}_{2}$ (with purity $97 \%$ ), $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ (with purity $99 \%$ ),
 N,N-diisopropylethylamine (DIPEA) (with purity 99\%), 1,8-diazabicycloundec-7-ene (DBU) (with purity 98\%), 1,4-diazabicyclo[2.2.2]octane (DABCO) (with purity $98 \%$ ), $n$-tetrabutylammoniumiodide $\quad\left(n-\mathrm{Bu}_{4} \mathrm{NI}\right) \quad$ (with purity $98 \%$ ), $n$ tetrabutylammoniumbromide ( $n-\mathrm{Bu} \mathbf{4}_{4} \mathrm{NBr}$ ) (with purity $98 \%$ ), zinc chloride $\left(\mathrm{ZnCl}_{2}\right)$ (with purity 98\%), dimethyl sulphoxide (DMSO) (with purity 99.7\%) and potassium carbonate (with purity $99 \%$ ), $\mathrm{K}_{3} \mathrm{PO}_{4}$ (with purity $98 \%$ ), $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ (with purity $99 \%$ ), purchased from Sigma-Aldrich were used without further purification. The bases $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{~K}_{3} \mathrm{PO}_{4}$ and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ dried at $150-170{ }^{\circ} \mathrm{C}$ over oil bath and ${ }^{t} \mathrm{BuOK}$ dried with hot air gun. Diethyl ether and toluene were dried over sodium/ benzophenone. DCM, DCE, DMF and DMA dried over calcium hydride. Acetonitrile dried over $\mathrm{P}_{2} \mathrm{O}_{5}$. Acme's silica gel (60-120 mesh) was used for column chromatography (approximately 20 g per one gram of crude material).

The following 2-bromobenzaldehydes $\mathbf{3 5 a}-\mathbf{3 5 h}{ }^{42}$ were synthesized using literature reported bromination of corresponding benzaldehydes and 2bromoacetophenones $\mathbf{3 7 a - 3 7} \mathbf{h}^{9 \mathrm{k}}$ were synthesized using literature reported bromination of corresponding 2-bromobenzaldehydes. aryl iodides such as 4-iodo-1,2dimethoxybenzene 61c and 1-iodo-2,3,4-trimethoxybenzene 61d were synthesized using literature reported bromination of corresponding 1,2-dimethoxybenzene, 1,2,3trimethoxybenzene. ${ }^{43}$

## I.5.1 Synthesis of 3,9-dimethoxy-7-methyl-5H dibenzo[a,c][7]annulen-5-

 one:
## General Procedure-1 for [Pd]-Mediated Cyclization (GP-1):

In an oven dried Schlenk tube, under nitrogen atmosphere were added 2bromoacetophenones 37 ( $100-150 \mathrm{mg}, 0.30$ to 0.58 mmol ), $\mathrm{Pd}(\mathrm{OAc})_{2}(2 \mathrm{~mol} \%)$, Xantphos ( $4 \mathrm{~mol} \%$ ) and $\mathrm{K}_{3} \mathrm{PO}_{4}$ ( 0.60 to 1.16 mmol ) followed by addition of dry DMF $(2 \mathrm{~mL})$. The resulted reaction mixture was stirred at $150{ }^{\circ} \mathrm{C}$ for 45 min to 2 h . The
progress of the reaction was monitored by TLC till the reaction was completed. The reaction mixture was then quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and the aqueous layer was extracted with ethyl acetate ( $3 \times 20 \mathrm{~mL}$ ). The organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the product 40 (41-50\%).

7-Methyl-5H-dibenzo[a,c][7]annulen-5-one (40a): GP-1 was carried out with 2bromoacetophenone $\mathbf{3 7 a}(100 \mathrm{mg}, 0.50 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.3 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos $(11.6 \mathrm{mg}, 4 \mathrm{~mol} \%), \mathrm{K}_{3} \mathrm{PO}_{4}(213 \mathrm{mg}, 1.00 \mathrm{mmol})$ and dry DMF $(2 \mathrm{~mL})$. The resulted reaction mixture was stirred at preheated oil bath $150{ }^{\circ} \mathrm{C}$ for 45 min . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate 96:04 to 92:08) furnished the product 40a ( $25 \mathrm{mg}, 45 \%$ ), as viscous liquid. [TLC control $R_{f}(\mathbf{3 7 a})=0.55, R_{f}(\mathbf{4 0 a})=0.50$ (petroleum ether/ethyl acetate $90: 10, \mathrm{UV}$ detection)]

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }=3062,2957,2853,1652,1593,1439$, $1377,1356,1307,1250,1121,1003,850,771,735,621 \mathrm{~cm}^{-1}$.
${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, 400 \mathrm{MHz}\right): \delta=7.79$ (dd, $2 \mathrm{H}, J=7.6$ and $5.3 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), $7.74-$ 7.69 (m, 2H, Ar-H), 7.63 (ddd, 1H, $J=7.7,7.6$ and $1.3 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), 7.53 (dd, 1H, $J=7.7$ and $7.6 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.49(\mathrm{~d}, 1 \mathrm{H}, J=3.3 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.47$ (d, 1H, J=3.3 Hz, Ar-H), 6.62 (s, $1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}$ ), 2.44 (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ) ppm.
${ }^{13} \mathbf{C}-$ NMR $\left(\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}\right): \delta=194.0(\mathrm{~s}, \mathrm{Ar}-\mathrm{C}=\mathrm{O}), 144.8$ ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 142.0 ( s , Ar-C), 137.5 (s, Ar-C), 137.3 (s, Ar-C), 135.7 (s, Ar-C), 133.2 (d, Ar-CH), 131.9 (d, ArH), 131.2 (d, Ar-CH), 130.0 (d, Ar-CH), 128.6 (d, Ar-CH), 128.1 (d, Ar-CH), 127.8 (d, Ar-CH), 127.3 (d, Ar-CH), 127.1 (d, Ar-CH), 24.4 (q, $\mathrm{CH}_{3}$ ) ppm.

HR-MS (ESI $\left.{ }^{+}\right): \mathrm{m} / \mathrm{z}$ calculated for $\left[\mathrm{C}_{32} \mathrm{H}_{25} \mathrm{O}_{2}\right]^{+}=[2(\mathrm{M}+\mathrm{H})]^{+}: 441.1849$; found 441.1836.

3,9-Bis(benzyloxy)-7-methyl-5H-dibenzo[a,c][7]annulen-5-one (40b): GP-1 was carried out with 2-bromoacetophenone 37b ( $120 \mathrm{mg}, 0.39 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OAc})_{2}(1.8 \mathrm{mg}, 2$ $\mathrm{mol} \%)$, Xantphos ( $9.1 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), $\mathrm{K}_{3} \mathrm{PO}_{4}(167 \mathrm{mg}, 0.79 \mathrm{mmol})$ and dry DMF ( 2 mL ). The resulted reaction mixture was stirred at preheated oil bath $150{ }^{\circ} \mathrm{C}$ for 1.5 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate $92: 08$ to $85: 15$ ) furnished the product 40 b ( $35 \mathrm{mg}, 41 \%$ ), as viscous liquid. [TLC control $R_{f}(\mathbf{3 7 b})=0.50, R_{f}(\mathbf{4 0 b})=0.40$ (petroleum ether/ethyl acetate 80:20, UV detection)]

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }=3064,3034,2923,2855,1644,1602$, 1570, 1483, 1410, 1337, 1279, 1236, 1182, 1026, 813, 735, $696 \mathrm{~cm}^{-1}$.
${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{4 0 0} \mathbf{~ M H z}\right): \delta=7.68(\mathrm{~d}, 1 \mathrm{H}, J=8.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.65(\mathrm{~d}, 1 \mathrm{H}$, $J=8.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.54-7.29(\mathrm{~m}, 11 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.27$ (d, 1H, J=2.6 Hz, Ar-H), 7.24 (dd, $1 \mathrm{H}, J=8.8$ and $2.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), 7.09 (dd, $1 \mathrm{H}, J=8.8$ and $2.6 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), 6.60 (s, 1H, ArH), 5.15 (s, 2H, $\mathrm{Ph}-\mathrm{CH}_{2} \mathrm{O}$ ), 5.14 (s, 2H, $\mathrm{Ph}-\mathrm{CH}_{2} \mathrm{O}$ ), 2.39 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ) ppm.
${ }^{13} \mathbf{C}-$ NMR ( $\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}$ ): $\delta=193.4$ (s, Ar-C=O), 158.2 ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 157.5 ( s , Ar-C), 144.8 (s, Ar-C), 142.2 (s, Ar-C), 136.5 (s, Ar-C), 136.4 (s, Ar-C), 136.3 (s, ArC), 132.9 (d, Ar-CH), 132.8 (d, Ar-H), 131.3 (d, Ar-CH), 130.7 (s, Ar-C), 130.6 (s, ArC), 128.7 (d, 2C, Ar-CH), 128.6 (d, 2C, Ar-CH), 128.2 (d, Ar-CH), 128.1 (d, Ar-CH), 127.6 (d, 2C, Ar-CH), 127.5 (d, 2C, Ar-CH), 119.9 (d, Ar-CH), 115.3 (d, Ar-CH), 113.3 (d, Ar-CH), 110.9 (d, Ar-CH), 70.3 (t, Ph-CH2O), 70.2 (t, Ph-CH2O), 24.6 (q, $\mathrm{CH}_{3}$ ) ppm.

HR-MS (ESI ${ }^{+}$): m/z calculated for $\left[\mathrm{C}_{30} \mathrm{H}_{24} \mathrm{NaO}_{3}\right]^{+}=[\mathrm{M}+\mathrm{Na}]^{+}$: 455.1618; found 455.1611 .

3,9-Dimethoxy-7-methyl-5H-dibenzo[a,c][7]annulen-5-one (40c): GP-1 was carried out with 2-bromoacetophenone 37 c ( $100 \mathrm{mg}, 0.44 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OAc})_{2}(2.0 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $10.1 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), $\mathrm{K}_{3} \mathrm{PO}_{4}(185 \mathrm{mg}, 0.87 \mathrm{mmol})$ and dry DMF ( 2 mL ). The resulted reaction mixture was stirred at preheated oil bath $150^{\circ} \mathrm{C}$ for 1.5 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate $85: 15$ to $80: 20$ ) furnished the product $\mathbf{4 0 c}(31 \mathrm{mg}, 50 \%)$, as white solid (recrystallized from a mixture of petroleum ether/dichloromethane). m. p.: 125-127 ${ }^{\circ} \mathrm{C}$. [TLC control $R_{f}(\mathbf{3 7 c})=0.50, R_{f}(\mathbf{4 0 c})=0.40$ (petroleum ether/ethyl acetate 80:20, UV detection)]

IR (MIR-ATR, 4000-600 $\mathbf{~ c m}^{-1}$ ): $v_{\max }=3001,2934,2837,1643,1603,1571$, $1484,1408,1337,1281,1240,1174,1039,814,753,722,614 \mathrm{~cm}^{-1}$.
${ }^{1} \mathbf{H}-\mathrm{NMR}\left(\mathbf{C D C l}_{3}, 400 \mathrm{MHz}\right): \delta=7.69(\mathrm{~d}, 1 \mathrm{H}, J=8.9 \mathrm{~Hz}, \operatorname{Ar}-\mathrm{H}), 7.66(\mathrm{~d}, 1 \mathrm{H}$, $J=8.9 \mathrm{~Hz}$, Ar-H), 7.28 (d, $1 \mathrm{H}, J=2.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.20(\mathrm{~d}, 1 \mathrm{H}, J=2.8 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.18$ (dd, $1 \mathrm{H}, J=8.9$ and $2.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), 7.04 (dd, 1H, $J=8.9$ and $2.8 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 6.61$ (d, 1H, $J=0.9$ $\mathrm{Hz}, \mathrm{Ar}-\mathrm{H}$ ), $3.89\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{OCH}_{3}\right), 3.88\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{Ar}-\mathrm{OCH}_{3}\right), 2.43\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm}$.
${ }^{13} \mathbf{C}-$ NMR ( $\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}$ ): $\delta=193.6$ ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}=\mathrm{O}$ ), 159.0 ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 158.4 ( s , Ar-C), 144.8 (s, Ar-C), 142.3 (s, Ar-C), 136.3 (s, Ar-C), 132.9 (d, Ar-CH), 132.8 (d, ArCH), 131.3 (d, Ar-CH), 130.5 (s, Ar-C), 130.4 (s, Ar-C), 119.4 (d, Ar-CH), 114.5 (d, Ar-CH), 112.2 (d, Ar-CH), 109.7 (d, Ar-CH), 55.6 (q, Ar- $\mathrm{OCH}_{3}$ ), 55.4 (q, Ar- $\mathrm{OCH}_{3}$ ), $24.6\left(\mathrm{q}, \mathrm{CH}_{3}\right) \mathrm{ppm}$.

HR-MS (ESI ${ }^{+}$: $\mathrm{m} / \mathrm{z}$ calculated for $\left[\mathrm{C}_{18} \mathrm{H}_{17} \mathrm{O}_{3}\right]^{+}=[\mathrm{M}+\mathrm{H}]^{+}$: 281.1172; found 281.1161.

3,9-Bis(benzyloxy)-2,10-dimethoxy-7-methyl-5H-dibenzo[a,c][7]annulen-5-one
(40d): GP-1 was carried out with 2-bromoacetophenone $\mathbf{3 7 d}$ ( $100 \mathrm{mg}, 0.30 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OAc})_{2}(1.3 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $6.9 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), $\mathrm{K}_{3} \mathrm{PO}_{4}(127 \mathrm{mg}, 0.60 \mathrm{mmol})$ and dry DMF ( 2 mL ). The resulted reaction mixture was stirred at preheated oil bath $150{ }^{\circ} \mathrm{C}$ for 2 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate 80:20 to 70:30) furnished the product 40d ( $32 \mathrm{mg}, 43 \%$ ), as brownish yellow semi-solid. [TLC control $R_{f}(\mathbf{3 7 d})=0.60, R_{f}(\mathbf{4 0 d})=0.40$ (petroleum ether/ethyl acetate 60:40, UV detection)]

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{\mathbf{- 1}}$ ): $v_{\max }=2932,1630,1589,1509,1455,1383$, 1257, 1218, 1162, 1070, 1020, 858, 734, $698 \mathrm{~cm}^{-1}$.

## I.5.2 Synthesis of $\alpha$-aryl ketones:

## General procedure-2 for $\boldsymbol{\alpha}$-arylation of ketones (GP-2):

In an oven dried Schlenk tube under nitrogen atmosphere, were added aryliodides 61a$61 f(0.50 \mathrm{mmol}), 2$-bromoacetophenone 37a-37c $(0.55 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2 \mathrm{~mol} \%)$, Xantphos ( $4 \mathrm{~mol} \%$ ) and ${ }^{t} \mathrm{BuOK}(0.65 \mathrm{mmol})$ followed by addition of dry toluene ( 4 $\mathrm{mL})$. The resulted reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for 45 min to 3 h . The progress of the reaction was monitored by TLC till the reaction was completed. The reaction mixture was then quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and the aqueous layer was extracted with ethyl acetate $(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under in vacuo. The crude product was purified on a silica gel column chromatography using petroleum ether/ethyl acetate which furnished the product 62ag-62gf (61-92\%).

1-(2-Bromophenyl)-2-(3,4-dimethoxyphenyl)ethanone (62ac): GP-2 was carried out with aryliodide $61 \mathbf{c}(132.0 \mathrm{mg}, 0.50 \mathrm{mmol})$, 2-bromoacetophenone $\mathbf{3 7 a}$ ( $109.4 \mathrm{mg}, 0.55$ $\mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $11.6 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), ${ }^{t} \mathrm{BuOK}(72.9 \mathrm{mg}$, $0.65 \mathrm{mmol})$ and dry toluene $(4 \mathrm{~mL})$ at $80^{\circ} \mathrm{C}$ for 45 min . Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate, $85: 15$ to $80: 20$ ) furnished the product 62ac ( $155 \mathrm{mg}, 92 \%$ ) as yellow solid, recrystallized the solid with dichloromethane/hexane, m. p. $74-76{ }^{\circ} \mathrm{C}$. [TLC control (petroleum ether/ethyl acetate $90: 10), R_{f}(\mathbf{3 7 a})=0.55, R_{f}(\mathbf{6 1} \mathbf{c})=0.45$ and $R_{f}(\mathbf{6 2 a c})=0.20, \mathrm{UV}$ detection $]$.

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{-1}$ ): $v_{\max }=2956,2923,2852,1697,1587,1512$, $1463,1422,1259,1154,1140,1025,791,757,678 \mathrm{~cm}^{-1}$.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, 400 \mathrm{MHz}\right): \delta=7.57(\mathrm{~d}, 1 \mathrm{H}, J=7.8 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}), 7.35-7.15(\mathrm{~m}$, $3 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 6.78$ (d, 1H, J=8.7 Hz, Ar-H), 6.76 (dd, 1H, J=8.7 and $1.9 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}$ ), 6.74
(d, 1H. J=1.9 Hz, Ar-H), 4.15 (s, 2H, CH2), 3.83 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{Ar}_{\mathrm{H}}-\mathrm{OCH}_{3}$ ), 3.82 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{Ar}-$ $\mathrm{OCH}_{3}$ ) ppm.
${ }^{13} \mathbf{C}-$ NMR ( $\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}$ ): $\delta=201.8$ ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}=\mathrm{O}$ ), 148.9 ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 148.1 ( s , Ar-C), 141.4 ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 133.5 (d, $\mathrm{Ar}-\mathrm{CH}$ ), 131.4 (d, $\mathrm{Ar}-\mathrm{CH}$ ), 128.6 (d, $\mathrm{Ar}-\mathrm{CH}$ ), 127.2 (d, Ar-CH), 125.8 (s, Ar-C), 121.9 (d, Ar-CH), 118.6 ( $\mathrm{s}, \mathrm{Ar}-\mathrm{C}$ ), 112.7 (d, Ar-CH), 111.2 (d, Ar-CH), $55.8\left(\mathrm{q}, 2 \mathrm{C}, 2 \times \mathrm{Ar}-\mathrm{OCH}_{3}\right), 49.0\left(\mathrm{t}, \mathrm{CH}_{2}\right) \mathrm{ppm}$.

HR-MS (ESI ${ }^{+}$): m/z calculated for $\left[\mathrm{C}_{16} \mathrm{H}_{16}{ }^{79} \mathrm{BrO}_{3}\right]^{+}=[\mathrm{M}+\mathrm{H}]^{+}: 335.0277$; found 335.0294, $\left[\mathrm{C}_{16} \mathrm{H}_{16}{ }^{81} \mathrm{BrO}_{3}\right]^{+}=[\mathrm{M}+\mathrm{H}]^{+}: 337.0259$; found 337.0274.

Methyl-4-[2-(2-bromophenyl)-2-oxoethyl]benzoate (62ae): GP-2 was carried out with aryliodide 61e ( $131.0 \mathrm{mg}, 0.50 \mathrm{mmol}$ ), 2-bromoacetophenone $\mathbf{3 7 a}$ ( $109.4 \mathrm{mg}, 0.55$ $\mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $11.6 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), ${ }^{t} \mathrm{BuOK}(72.9 \mathrm{mg}$, $0.65 \mathrm{mmol})$ and dry toluene $(4 \mathrm{~mL})$ at $80^{\circ} \mathrm{C}$ for 45 min . Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate, $92: 8$ to $85: 15$ ) furnished the product $\mathbf{6 2 a e}(139.8 \mathrm{mg}, 80 \%)$ as yellow semi-solid. [TLC control (petroleum ether/ethyl acetate $95: 10), R_{f}(\mathbf{3 7 a})=0.55, R_{f}(\mathbf{6 1 e})=0.75$ and $R_{f}(\mathbf{6 2 a e})=0.30$, UV detection].

IR (MIR-ATR, 4000-600 $\mathbf{~ c m}^{-1}$ ): $v_{\max }=2919,2850,1717,1587,1463,1434$, 1280, 1198, 1181, 1107, 1022, 988, $757 \mathrm{~cm}^{-1}$.

## I.5.3 Synthesis of bi-aryls:

## General Procedure-3 for synthesis isopropyl secondary alcohol (GP-3):

To a cold $\left(-10^{\circ} \mathrm{C}\right)$, magnetically stirred 2-bromobenzaldehyde 35 ( 1 mmol ), was added isopropylmagnesium bromide ( 8 mmol ) [prepared from magnesium ( 8 mmol ) and isopropyl bromide ( 16 mmol ) and a catalytic amount of iodine in 10 mL of dry ether]. The reaction mixture was stirred at $-10^{\circ} \mathrm{C}$ to RT for 4 h . It was then poured into a cold saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and the aqueous layer was extracted with ethyl acetate $(3 \times 30 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate) furnished the products 68 (70-86\%).

1-(2-Bromophenyl)-2-methylpropan-1-ol (68a): GP-3 was carried out with 2bromobenzaldehyde 35a ( 1.5 g , 8.11 mmol ), isopropylmagnesium bromide ( 64.88 mmol ) [prepared from magnesium $(1.5 \mathrm{~g}, 64.88 \mathrm{mmol})$, isopropyl bromide $(12.2 \mathrm{~mL}$, 129.76 mmol ) and catalytic amount of iodine in 80 mL of dry ether]. The reaction stirred at $-10^{\circ} \mathrm{C}$ to RT for 4 h Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate 97:03 to 95:05) furnished the product 68a (1.3 g, 73\%) as colorless oil. [TLC control (petroleum ether/ethyl acetate 95:05, $R_{f}(\mathbf{3 5 a})=0.70, R_{f}(\mathbf{6 8 a})=0.60, \mathrm{UV}$ detection $\left.)\right]$.

IR (MIR-ATR, 4000-600 $\mathbf{~ c m}^{-1}$ ): $v_{\max }=3397,2960,2922,2851,1466,1439$, 1282, 1366, 1197, 1006, 749, $682 \mathrm{~cm}^{-1}$.

## General Procedure-4 for synthesis of cyclohexyl secondary alcohol (GP-4):

To a cold $\left(-50^{\circ} \mathrm{C}\right)$, magnetically stirred 2-bromobenzaldehyde $35(1 \mathrm{mmol})$ in THF (2 mL ), was added cyclohexylmagnesium bromide ( 4 mmol ) in Dry THF 2 mL [prepared from magnesium ( 4 mmol ) and cyclohexyl bromide ( 4 mmol ) and a catalytic amount of iodine in 5 mL of dry THF]. The reaction mixture was stirred at $-50^{\circ} \mathrm{C}$ to RT for 2 h . It was then poured into a cold saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and the aqueous layer was extracted with ethyl acetate $(3 \times 30 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate) furnished the product 80 (40-72\%).

(2-Bromophenyl)(cyclohexyl)methanol (80a): GP-4 was carried out with 2bromobenzaldehyde 35a ( $2.0 \mathrm{mg}, 10.81 \mathrm{mmol}$ ) in 15 mL THF, cyclohexylmagnesium bromide $(43.24 \mathrm{mmol})$ [prepared from magnesium $(1.04 \mathrm{~g}, 43.24 \mathrm{mmol})$, cyclohexyl
bromide ( $5.0 \mathrm{~mL}, 43.24 \mathrm{mmol}$ ) and catalytic amount of iodine in 25 mL of dry THF]. The reaction stirred at $-50^{\circ} \mathrm{C}$ to RT for 2 h . Purification of the residue on a Silica gel column chromatography (petroleum ether/ethyl acetate $97: 3$ to $95: 5$ ) furnished the product $80 \mathrm{a}(1.51 \mathrm{~g}, 52 \%)$ colorless viscous liquid. [TLC control (petroleum ether/ethyl acetate $90: 10, R_{f}(\mathbf{3 5 a})=0.70, R_{f}(\mathbf{8 0 a})=0.55$, UV detection $\left.)\right]$

IR (MIR-ATR, 4000-600 $\mathbf{~ c m}^{-1}$ ): $v_{\max }=3392,2924,2851,1567,1467,1448$, 1346, 1263, 1082, 1016, 754, $729 \mathrm{~cm}^{-1}$.

## General procedure for the synthesis of bi-aryls (GP-6):

In an oven dried Schlenk tube under nitrogen atmosphere, were added ortho-bromoisopropylketone/ortho-bromocyclohexylketone $\mathbf{6 9 / 8 1}(100 \mathrm{mg}, 0.27$ to 0.44 $\mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(4 \mathrm{~mol} \%)$, Xantphos $(4 \mathrm{~mol} \%)$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(1.08$ to 1.76 mmol$)$ followed by addition of dry toluene $(2 \mathrm{~mL})$. The resulted reaction mixture was stirred at
$100^{\circ} \mathrm{C}$ for 16 h . The progress of the reaction was monitored by TLC till the reaction was completed. The reaction mixture was quenched by an addition of aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and the aqueous layer was extracted with ethyl acetate $(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the product 70/82 (54-97\%)/(57-88\%).

1-(2'-Isobutyryl-1,1'-biphenyl-2-yl)-2-methylprop-2-en-1-one (70a): GP-6 was carried out with ortho-bromoisopropylketone 69a ( $100 \mathrm{mg}, 0.44 \mathrm{mmol}$ ), $\mathrm{Pd}(\mathrm{OAc})_{2}(4.0$ $\mathrm{mg}, 0.018 \mathrm{mmol})$, Xantphos ( $10.2 \mathrm{mg}, 0.018 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(243 \mathrm{mg}, 1.76 \mathrm{mmol})$, dry toluene ( 2 mL ) at $100{ }^{\circ} \mathrm{C}$ for 16 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate $92: 08$ to $85: 15$ ) furnished the product 70a (62 mg, 97\%), as white solid (recrystallized from a mixture of petroleum ether/dichloromethane), m.p.: 60-62 ${ }^{\circ} \mathrm{C}$. [TLC control $R_{f}(\mathbf{6 9 a})=0.60, R_{f}(\mathbf{7 0 a})=0.45$ (petroleum ether/ethyl acetate 90:10, UV detection)]

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{-1}$ ): $v_{\max }=2965,2924,2852,1687,1658,1594$, 1466, 1435, 1379, 1328, 1214, 1196, 1015, 977, 948, 906, $750 \mathrm{~cm}^{-1}$.

\title{
SYNTHESIS OF \(\beta\)-ARYL ALLYLIC ALCOHOLS AND SEQUENTIAL DOMINO PROCESS TO 1,3-DIHYDRO ISOBENZOFURANS THROUGH \\ [Pd]-CATALYSIS
}

\section*{II. 1 INTRODUCTION:}

Transition-metal mediated reactions are potent synthetic tools for the construction of natural products of biological significance or for building different analogues containing the fundamental core of natural products. These transition metals help in complexness with the reactants to bring organic molecules proximally closer and in turn help in the formation of \(\mathrm{C}-\mathrm{C}, \mathrm{C}-\mathrm{O}\) and \(\mathrm{C}-\mathrm{N}\) bonds through cross-coupling
reactions, which otherwise which are very difficult to be constructed by various classical methods. Amongst the various transition metals available, Pd-catalyzed transformations play a key role in affording various functionally advanced materials, fluorescent compounds, pharmaceutical lead molecules and other high-value commercial products. \({ }^{44}\) In particular, [Pd]-catalyzed approaches are highly valued for their utility in the construction of C-C and C-heteroatom bonds in the field of synthetic organic chemistry. Palladium is known to catalyze numerous cross-coupling reactions, in this context, notable [Pd]-catalyzed cross coupling reactions are Heck, \({ }^{45}\) Stille, \({ }^{46}\) Suzuki, \({ }^{47}\) Sonogashira, \({ }^{48}\) Buckwald-Hartwig, \({ }^{49}\) Mizoroki-Heck \({ }^{50}\) and Jeffery-Heck. \({ }^{51}\) Efficiency in delivering the desired products, reducing the formation of non-toxic byproducts and the wide functional group tolerance makes transition-metals extremely useful in synthetic organic chemistry.

\section*{II. 2 BACKGROUND:}
[Pd]-mediated oxidative coupling reactions have been known since 1960's. In 1968, Heck reported cross coupling reactions of olefins with diphenyl-mercury. In the catalytic cycle, initially, the aryl-palladium-halide species were generated in-situ by the reaction of the catalyst \(\mathrm{LiPdCl}_{3}\) with diphenyl-mercury, which upon reacting with ethylene gas \(\mathbf{1}\) gave the styrene product 2a (Scheme II.1). \({ }^{52}\)

Scheme II. 1

Subsequently, in the same year (1968), coupling of phenyl-mercury salt \(\mathbf{3}\) with allylic alcohol 4 in the presence of [Pd]-catalyst was reported by Heck. Interestingly, in this case, unlike the reaction with isolated olefins, it produced the \(\beta\)-phenyl propanaldehyde 7 as the end product, albeit in poor yield (Scheme II.2). \({ }^{53}\)

Scheme II. 2

Interestingly, as a subsequent development to the Heck coupling, in the year 1971 Mizoroki first reported [Pd]-catalyzed cross coupling of iodobenzene 5a with olefins \(\mathbf{2 a}\) for the formation of styrenes \(\mathbf{2 b}\) and \(\mathbf{2 c}\) using catalytic amount of palladium chloride and in the presence of base KOAc in methanol (Scheme II.3). \({ }^{54}\)

Scheme II. 3

One year later, in 1972, Heck reported an optimized and improved condition to the coupling reaction developed by Mizoroki, for the coupling of iodobenzene 5a with olefins 2a by employing \(\mathrm{Pd}(\mathrm{OAc})_{2}\) and \(\mathrm{Bu}_{3} \mathrm{~N}\) (Scheme II.4). \({ }^{55}\)

\section*{Scheme II. 4}

Later, in the year 1976, Heck \(^{56}\) (Schemes II.5) and Chalk \({ }^{57}\) (Scheme II.6) independently and at the same time demonstrated that aryl palladium halide can be obtained by using aryl halide 5a and catalytic amount of a palladium catalyst, instead of using stoichiometric amounts of mercury salts. Interestingly, the coupling using aryl
halide 5a furnished the carbonyl compounds 7 with improved yield, under the conditions developed by Heck.

Scheme II. 5
by Chalk et al.:

\section*{Scheme II. 6}

Muzart and co-workers had also demonstrated an approach for the synthesis of \(\beta\)-aryl ketones 7 from allylic alcohols 4 (Scheme II.7). In this reaction, the Heck arylation of allylic alcohols \(\mathbf{4}\) was carried out in molten salts without using any solvents and ligands. \({ }^{58}\)

Scheme II. 7

The research groups of Wagner and Mioskowski developed a [Pd]-mediated synthesis of dihydrochalcones \(\mathbf{7}\) using allylic alcohols \(\mathbf{4}\) and aryl iodide \(\mathbf{5 g}\) as coupling partners (Scheme II.8). \({ }^{59}\)
 \(+\)

4

7 (12 to \(74 \%\) )

\section*{Scheme II. 8}

Normally, the Heck reaction is carried out at elevated temperatures. Therefore, Jeffery developed a mild catalytic method for the arylation of allylic alcohols \(\mathbf{4}\) which led to the formation of either \(\beta\)-aryl carbonyls 7 or \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) based on the conditions employed at low temperature range (Scheme II.9). \({ }^{51}\)

Scheme II. 9

Jeffery used stoichiometric amount of phase transfer reagent \(n-\mathrm{Bu}_{4} \mathrm{NCl}\) as an additive. These reagents allow the reaction to proceed near to the room temperature and direct the formation of selective \(\beta\)-aryl carbonyl compounds 7 (Scheme II.10). \({ }^{60}\) Therefore, this reaction was named as Jeffery-Heck reaction. In the case of 1-bromo-2iodobenzene 5e, under traditional Jeffery's conditions, relatively more reactive iodo substituent reacted selectively with allylic alcohol 4 than the bromo one (Scheme II.11). \({ }^{61}\)
\(1 \% \mathrm{Pd}(\mathrm{OAc})_{2}\)

Scheme II. 10

Scheme II. 11

In our quest for the synthesis of \(\beta\)-aryl allylic alcohol 6, the research group of Jeffery extensively investigated on the Heck reaction. As a result, in 1991, Jeffery discovered a new catalytic system for the coupling of aryl iodide \(\mathbf{5}\) with allylic alcohols 4 using silver salts ( AgOAc or \(\mathrm{Ag}_{2} \mathrm{CO}_{3}\) ) as additives to the traditional Jeffery conditions, which selectively furnished the \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) by preventing the subsequent C-C double bond isomerization (Scheme II.12). \({ }^{62}\)

Scheme II. 12

S-K Kang et al. reported the cross coupling between iodobenzene 5a and allylic diols 4 using \(\mathrm{Pd}(\mathrm{OAc})_{2} / n-\mathrm{Bu}_{3} \mathrm{P}\) as the catalytic system. When \(\mathrm{Et}_{3} \mathrm{~N}\) was used as a base, furnished phenyl-substituted hydroxy ketone 7 , whereas, the reaction with \(\mathrm{K}_{2} \mathrm{CO}_{3}\), gave phenyl substituted allylic diol 7 (Scheme II.13). This selectivity is attributed to the chelation of \(\beta\)-hydroxy group with palladium metal. The necessity and the role of hydroxyl group at \(\beta\)-position are proved by performing the reaction on the substrate without \(\beta\)-hydroxyl group, which furnished two isomeric products (Scheme II.14). \({ }^{63}\)

Scheme II. 13

\section*{II.3. RESULTS AND DISCUSSION:}

\section*{II.3.1.Synthesis of \(\beta\)-aryl allylic alcohols via [Pd]-catalysis:}

In continuation of our research interest on [Pd]-catalysis, it was envisioned that the targeted dihydrochalcones 7 could be achieved by employing [Pd]-catalyzed cross-
coupling of aryl halides 5 with allylic alcohols 4 under traditional Jeffery-Heck conditions (Scheme II.15). \({ }^{60}\)

\section*{Scheme II. 15}

Thus, the synthetic study was initiated with the bromination of benzaldehydes under reported conditions. \({ }^{42}\) The required allylic alcohols \(\mathbf{4 h}-\mathbf{4 o}\) were synthesized by using the standard vinylmagnesium bromide addition to 2-bromobenzaldehydes \(\mathbf{5 h} \mathbf{- 5 0}\). The corresponding secondary allylic alcohols \(\mathbf{4 h} \mathbf{- 4 o}\) were obtained in very good to excellent yields ( \(80-94 \%\) ), as described in Table II.1. \({ }^{64}\)

Table II.1: Synthesis of ortho-bromo aryl allylic alcohols 4h-4o from 2-bromo benzaldehydes 5h-50.

4n (94\%)

40 (90\%)

Reaction conditions: \({ }^{a}\) All the reactions carried out with 2-bromobenzaldehydes \(\mathbf{5 h} \mathbf{- 5 0} 10 \mathrm{mmol}, 0.5 \mathrm{M}\) in THF. \({ }^{b}\) Isolated yields of chromatographically pure products.

Figure II.1.1: \({ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})\) spectrum of \(\mathbf{4 n}\) in \(\mathrm{CDCl}_{3}\)

Figure II.1.2: \({ }^{13} \mathrm{C}\)-NMR ( 100 MHz ) spectrum of \(\mathbf{4 n}\) in \(\mathrm{CDCl}_{3}\)

The structure of ortho-bromo aryl allylic alcohols \(\mathbf{4 n}\) was confirmed from the spectral data analysis. IR spectra shows the absence of the absorption band due to carbonyl stretching of CHO group and the presence of broad absorption band due to OH stretching at \(3451 \mathrm{~cm}^{-1}\). In the \({ }^{1} \mathrm{H}-\mathrm{NMR}\) spectrum (Figure II.1.1), the presence of two individual singlets at \(\delta 6.99\) and 6.96 was due to two aromatic protons, the presence of doublet of a doublet of doublets at \(\delta 5.96\) having \(J=15.6,10.3\) and 5.4 Hz was due to olefinic methine group proton, the presence of doublet at \(\delta 5.50\) having \(J=5.4 \mathrm{~Hz}\) was due to CHOH group proton, the presence of doublet at \(\delta 5.35\) having coupling constant \(J_{\text {trans }}=15.6 \mathrm{~Hz}\) and one more doublet at \(\delta 5.18\) having coupling constant \(J_{\text {cis }}=10.8 \mathrm{~Hz}\) were due to olefinic methylene group two protons, \(\delta 3.84\) due to methoxy group three protons, \(\delta 3.83\) due to methoxy group three protons and the presence of broad singlet at \(\delta 2.30 \mathrm{ppm}\) was due OH group proton, elucidated the structure of ortho-bromo aryl allylic alcohols \(\mathbf{4 n}\). In addition, the 11 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.1.2) in which four quaternary carbon resonates at \(\delta 148.8,148.7,133.5\) and 112.3 due to four aromatic carbons, three methine carbons at \(\delta 138.5,115.1\) and 110.2 due to two aromatic methine carbons and one olefinic methine carbon, the presence of olefinic methylene carbon resonates at \(\delta 115.2\), the presence of \(\delta 73.3 \mathrm{ppm}\) was due to CHOH group carbon, the presence of \(\delta 56.1\) and 55.9 ppm were due to two methoxy group carbons, confirmed the structure of ortho-bromo aryl allylic alcohols \(\mathbf{4 n}\). The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{BrNaO}_{3}\right]^{+}=294.9941\) in the mass spectrum further established the structure \(\mathbf{4 n}\).

Now with the allylic alcohols \(\mathbf{4 h}\) in hand, the [Pd]-catalysis was carried out between 3-iodoanisole \(\mathbf{5 b}\) and the allylic alcohol \(\mathbf{4 h}\). The reaction was performed under typical Jeffery-Heck conditions. To our surprise, exclusively \(\beta\)-aryl allylic alcohol 6hb was isolated rather than the expected \(\beta\)-aryl carbonyl compound 7hb. \({ }^{\text {b }}\) After careful study of the literature, we realized that the usual Heck followed by double bond isomerization to give the carbonyl compounds was observed for those substrates having no ortho-substituents on the aromatic ring of the allylic alcohols. \({ }^{17}\) Therefore, from the
present study, it was thought that the bromo substituent at the ortho-position on the aromatic moiety of the allylic alcohol plays a major role to confine the rotation around C-C bond of the \(\mathrm{PdCH}-\mathrm{CH}(\mathrm{OH}) \mathrm{Ar}\) intermediate. The reason for the restricted rotation of the Pd-intermediate around the C-C bond may be due to the more bulky nature of ortho-bromoaryl moiety of the allylic alcohol and thus suppresses the formation of enol via the double isomerization. As a result, the reaction impeded after Mizoroki-Heck coupling and furnished \(\beta\)-aryl allylic alcohol \(\mathbf{6 h b}\).

To further optimize the reaction, it was investigated under different conditions and the results are as summarized in Table II.2. Initially, the reaction explored the allylic alcohol \(\mathbf{4 h}\) and 3-iodoanisole \(\mathbf{5 b}\). Thus, reaction in the presence of \(\mathrm{Pd}(\mathrm{OAc})_{2}\) catalyst, base \(\mathrm{NaHCO}_{3}\) and \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) as phase transfer reagent as an additive, in DMF as solvent at \(50^{\circ} \mathrm{C}\), gave the \(\beta\)-aryl allylic alcohol \(\mathbf{6 h b}\) in fair yield ( \(67 \%\), Table II.2, entry 1). Replacing \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) with TBAI, the desired product \(\mathbf{6 h b}\) was obtained in poor yield ( \(33 \%\), Table II.2, entry 2 ). While changing the base to \(\mathrm{K}_{2} \mathrm{CO}_{3}\) in the présence of TBAI and keeping other reaction parameters constant, furnished the product 6hb in moderate yield ( \(51 \%\), Table II.2, entry 3). Switching the solvents to toluene/acetonitrile, in the presence of bases \(\mathrm{K}_{2} \mathrm{CO}_{3} / \mathrm{NaHCO}_{3}\) and with the quaternary ammonium salts TBAI/TBAB produced the product \(\mathbf{6 h b}\) in poor to moderate yields (Table II.2, entries 4 to 8 ,). Interestingly, switching the bases to \(\mathrm{Cs}_{2} \mathrm{CO}_{3} / \mathrm{K}_{2} \mathrm{CO}_{3}\) in the presence of \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) in \(\mathrm{CH}_{3} \mathrm{CN}\), gave the product \(\mathbf{6} \mathbf{h b}\) in good yields (Table II.2, entries 9 and 10). On the other hand, the reaction in the presence of strong base \(\mathrm{Cs}_{2} \mathrm{CO}_{3}\) with TBAI in \(\mathrm{CH}_{3} \mathrm{CN}\) furnished the product \(\mathbf{6 h b}\) in moderate yields (51\%, Table II.2, entry 11). Gratifyingly, the product \(\mathbf{6} \mathbf{h b}\) yield was improved with the base \(\mathrm{NaHCO}_{3}\) in the presence of \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) in solvent \(\mathrm{CH}_{3} \mathrm{CN}(80 \%\), Table II.2, entry 12).

\end{tabular}
\({ }^{a}\) All reactions were carried out with \(\mathrm{Pd}(\mathrm{OAc})_{2}(5 \mathrm{~mol} \%), \mathrm{NaHCO}_{3}\) (2 equiv), \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) (1 equiv) under nitrogen atmosphere. \({ }^{b}\) Isolated yields of chromatographically pure products; for compounds \(\mathbf{6} \mathbf{h b}\), the first alphabet letter refers to the allylic alcohol part (4h) whereas the second letter indicates the aromatic ring coming from the aryl iodide \(\mathbf{5 b}\).

Microwave reactors have helped to decrease the reaction time required for many organic transformations. Also, it was proved in some cases that the yield of the products improved. \({ }^{65}\) Therefore, in addition to the conventional conditions, we became interested to apply microwave assisted conditions to the above developed reaction. Gratifyingly, the palladium catalysed reaction amenable under microwave irradiation as well (closed vessel, power: 250 W , temperature: \(50{ }^{\circ} \mathrm{C}\) ). The reactions were completed in much shorter reaction times \((1.5 \mathrm{~h})\) at \(50{ }^{\circ} \mathrm{C}\) and afforded the desired \(\beta\)-aryl allylic alcohol

6hb with comparable yields to that of the conventional one (i.e., for 24 h at \(50^{\circ} \mathrm{C}\) in an oil bath).

Now with the optimized conditions for the synthesis of \(\beta\)-aryl allylic alcohols 6hb in hand, we next aimed to check the scope and limitations of the method by performing the reaction on other systems as well. Thus, the optimized conditions were applied to different aryl iodides 5a-5d in conjunction with allylic alcohols 4h-40. Interestingly, the method was quite successful on a variety of aryl iodides 5a-5d in combination with allylic alcohols \(\mathbf{4 h}-\mathbf{4 o}\), and furnished the corresponding products 6ha6oc in fair to very good yields using conventional conditions (60 to 84\%, Table II.3). Also, it was found that the reaction was amenable under microwave irradiation conditions and delivered the products 6ha-6oc in comparable yields to that of the conventional one ( 56 to \(86 \%\), Table II.3).

The structure of \(\beta\)-aryl allylic alcohol \(\mathbf{6 h b}\) was further confirmed by IR and NMR data analysis. The presence of broad absorption band at \(3475 \mathrm{~cm}^{-1}\) because of OH stretching in the IR spectrum indicated the formation of the \(\beta\)-aryl allylic alcohol \(\mathbf{6} \mathbf{h b}\). In the \({ }^{1} \mathrm{H}-\mathrm{NMR}\) spectrum (Figure II.2.1), the presence of doublet of a doublet at \(\delta 7.60\) having \(J=7.8\) and 1.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.55\) having \(J=7.8\) and 1.5 Hz was due to one aromatic proton, doublet of doublet of doublets at \(\delta 7.34\) having \(J=7.8,7.3\) and 1.0 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.22\) having \(J=7.8\) and 7.8 Hz was due to one aromatic proton, doublet of a doublet of doublet at \(\delta 7.15\) having \(J=7.8,7.3\) and 2.0 Hz was due to one aromatic proton, doublet at \(\delta 6.98\) having \(J=7.8 \mathrm{~Hz}\) was due to one aromatic proton, doublet of a doublet at \(\delta 6.92\) having \(J=2.0\) and 2.0 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 6.80\) having \(J=7.8\) and 2.0 Hz was due to one aromatic proton, the presence of doublet at \(\delta 6.71\) having coupling constant \(J_{\text {trans }}=16.1 \mathrm{~Hz}\) was due to olefinic methine group, the presence of doublet of a doublet at \(\delta 6.32\) having \(J_{\text {trans }}=16.1 \mathrm{~Hz}\) and \(J=5.8 \mathrm{~Hz}\) was due to olefinic methine group proton, doublet at \(\delta 5.76\) having coupling constant \(J=5.8 \mathrm{~Hz}\) due to CHOH group proton, singlet at \(\delta 3.79\) due to \(\mathrm{Ar}-\mathrm{OCH}_{3}\) group three
protons and broad singlet at \(\delta 2.56 \mathrm{ppm}\) was due to due to hydroxyl proton, elucidated the structure of allylic alcohol \(\mathbf{6 h b}\).

6 hb

Figure II.2.2: \({ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})\) spectrum of \(\mathbf{6} \mathbf{h b}\) in \(\mathrm{CDCl}_{3}\)

In addition to it, 16 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.2.2), in which four quaternary carbons resonates at \(\delta 159.7,141.5,137.9\) and 122.4 were due to four aromatic carbons, the presence of 10 methine carbons at \(\delta 132.7,130.8,129.9\), \(129.5,129.1,127.9,127.8,119.3,113.5\) and 111.8 were due to eight aromatic methine carbons and two olefinic methine carbons, \(\delta 73.2\) was due to \(\mathrm{CH}(\mathrm{OH})\) group carbon and \(\delta 55.1 \mathrm{ppm}\) was due to \(\mathrm{Ar}-\mathrm{OCH}_{3}\) group carbon, confirmed the structure of allylic alcohol 6hb. The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{BrNaO}_{2}\right]^{+}=341.0153\). In the mass spectral data further confirmed the structure of \(\beta\)-aryl allylic alcohol \(\mathbf{6 h b}\).

After successful accomplishment of \(\beta\)-aryl allylic alcohols 6ha-6oc, to show the generality and applicability of the method, we further explored the reaction with 1-bromo-2-iodobenzenes \(\mathbf{5 e - 5 f}\) as coupling partners to the allylic alcohols 4h-4o. The optimized reaction conditions were implemented on 1-bromo-2iodobenzenes \(\mathbf{5 e}\) - \(\mathbf{5 f}\) as coupling partners to the allylic alcohols \(\mathbf{4}\) to obtain \(\beta\)-aryl allylic alcohols 6. Quite interestingly, the reaction was successful and furnished the desired \(\beta\) aryl allylic alcohols 6he-6of (Table II.4). Notably, in the present case the reaction was undertaken in a highly selective manner by making use of more reactive iodo substituent without effecting the bromo one (Table II.4).

To make the method more interesting, we were fascinated to employ the reaction on 2-bromobenzaldehyde \(\mathbf{5 h}\) as a coupling partner to that of allylic alcohols \(\mathbf{4}\), in which we envisioned the preferential reactivity of bromo substituent of 2bromobenzaldehyde \(\mathbf{5 h}\) over the other bromo substituent of the allylic alcohol partner 4 . Because, the bromo substituent on the electron deficient aromatic ring would be more reactive than that connected to a relatively more electron rich aromatic ring. Gratifyingly, the reaction under standard conditions was amenable and products \(\mathbf{6 h h}\) 6oh were obtained in good yields as summarized in Table II.4. As anticipated, the bromo substituent of 2-bromobenzaldehyde \(\mathbf{5 h}\) was more reactive towards the
palladium catalyst and certainly gave the corresponding coupled products \(\mathbf{6 h h} \mathbf{- 6 0 h}\) (Table II.4).

Table II.4: [Pd]-catalyzed reaction of allylic alcohols \(\mathbf{4 h}-\mathbf{4 o}\) with bromo-iodobenzenes \(\mathbf{5 e}-\mathbf{5 f}\), and 2-bromobenzaldehyde \(\mathbf{5 h}\) to furnish 6he-6oh. \({ }^{a, b}\)

Figure II.3.2: \({ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})\) spectrum of \(\mathbf{6 o e}\) in \(\mathrm{CDCl}_{3}\)

The structure of \(\beta\)-aryl allylic alcohol 6oe was further confirmed by IR and NMR data analysis. The presence of broad absorption band at \(3448 \mathrm{~cm}^{-1}\) because of OH stretching in the IR spectrum indicated the formation of the \(\beta\)-aryl allylic alcohol \(\mathbf{6 0 e}\). In the \({ }^{1} \mathrm{H}\)-NMR spectrum (Figure II.3.1), the presence of doublet at \(\delta 7.51\) having \(J=7.8 \mathrm{~Hz}\) was due to one aromatic proton, doublet at \(\delta 7.46\) having \(J=7.8 \mathrm{~Hz}\) was due to one aromatic proton, doublet of a doublet at \(\delta 7.21\) having \(J=7.5\) and 7.5 Hz was due to one aromatic proton, the presence of doublet at \(\delta 7.10\) having coupling constant \(J_{\text {trans }}=15.8\) Hz was due to olefinic methine group proton, doublet of a doublet at \(\delta 7.07\) having \(J=7.5\) and 7.5 Hz was due to one aromatic proton, singlet at \(\delta 7.00\) due to one aromatic proton, doublet of a doublet at \(\delta 6.21\) having \(J_{\text {trans }}=15.8\) and 5.5 Hz was due to olefinic methine group proton, doublet at \(\delta 5.80\) having \(J=5.5 \mathrm{~Hz}\) was due to benzylic methine proton, singlet at \(\delta 3.88\) was due to three methoxy protons, singlet at \(\delta 3.86\) was due to six protons of two methoxy groups and broad singlet at \(\delta 2.62 \mathrm{ppm}\) was due to OH group proton, elucidated the structure of allylic alcohol 6oe. In addition to it, 18 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.3.2) in which seven quaternary carbon resonates at \(\delta 153.1,150.6,143.5,137.0,136.5,123.8\) and 108.6 due to seven aromatic carbons, the presence of seven methine carbons resonates at \(\delta 132.8,132.6,129.5\), \(128.9,127.4,127.1\) and 106.3 were due to five aromatic methine carbons and two olefinic methine carbons, \(\delta 73.1\) was due to \(\mathrm{CH}(\mathrm{OH})\) group carbon, \(\delta 61.0\) was due to \(\mathrm{ArOCH}_{3}\) group carbon, \(\delta 60.9\) was due to \(\mathrm{ArOCH}_{3}\) group carbon and \(\delta 56.1 \mathrm{ppm}\) was due to \(\mathrm{ArOCH}_{3}\) group carbon, elucidated the structure of allylic alcohol 6oe. The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{Br}_{2} \mathrm{NaO}_{4}\right]^{+}=478.9464\) in the mass spectrum further established the structure of \(\beta\)-aryl allylic alcohol 6oe.

\(\stackrel{\circ}{\stackrel{\circ}{i}}\)

Figure II.4.2: \({ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})\) spectrum of \(\mathbf{6} \mathbf{h h}\) in \(\mathrm{CDCl}_{3}\)

The structure of \(\beta\)-aryl allylic alcohol \(\mathbf{6 h h}\) was further confirmed by IR and NMR data analysis. The presence of strong absorption band in IR spectrum at \(1688 \mathrm{~cm}^{-}\) \({ }^{1}\) due of the \(\mathrm{C}=\mathrm{O}\) stretch of the aldehyde group and broad absorption band at \(3409 \mathrm{~cm}^{-1}\) because of OH stretching indicated the formation of the \(\beta\)-aryl allylic alcohol \(\mathbf{6 h h}\). In the \({ }^{1} \mathrm{H}-\mathrm{NMR}\) spectrum (Figure II.4.1), the presence of singlet at \(\delta 10.23\) was due to CHO group proton, \(\delta 7.77\) having \(J=7.5 \mathrm{~Hz}\) was due to one aromatic proton, \(\delta 7.62\) having \(J=7.8 \mathrm{~Hz}\) was due to one aromatic proton, a multiplet in the region \(\delta 7.57-7.27\) accounts for the five aromatic protons and one olefinic proton, doublet of a doublet \(\delta\) 7.13 having \(J=15.0\) and 7.5 Hz was due to one aromatic proton, the presence of doublet of a doublet at \(\delta 6.26\) having \(J_{\text {trans }}=15.0\) and \(J=5.5 \mathrm{~Hz}\) was due to olefinic methine group proton, doublet at \(\delta 5.82\) having \(J=5.5 \mathrm{~Hz}\) was due to benzylic methine proton and broad singlet at \(\delta 3.10 \mathrm{ppm}\) was due to OH group proton, elucidated the structure of \(\beta\) aryl allylic alcohol \(\mathbf{6 h}\). In addition to it, 16 signals appeared in \({ }^{13} \mathrm{C}-\mathrm{NMR}\) spectrum (Figure II.4.2), at \(\delta 192.4\) indicate the presence of \(\mathrm{C}=\mathrm{O}\) group carbon, in which four aromatic quaternary carbon resonates at \(\delta 141.3,139.5,132.9\) and 122.4 , the presence of 10 methine carbons at \(\delta 135.4,133.7,132.8,131.1,129.2,127.9,127.8,127.7,127.6\) and 126.9 were due to eight aromatic methine carbons and two olefinic methine carbons, and \(\delta 73.1 \mathrm{ppm}\) was due to \(\mathrm{CH}(\mathrm{OH})\) group carbon, elucidated the structure of \(\beta\)-aryl allylic alcohol \(6 \mathbf{h h}\). The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\) \(\left[\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{BrNaO}_{2}\right]^{+}=338.9988\) in the mass spectrum further established the structure of \(\beta\) aryl allylic alcohol \(\mathbf{6 h h}\).

Assuming that the steric hindrance of the substituents at the ortho position accounted for the formation of \(\beta\)-aryl allylic alcohols 7 and to probe this hypothesis of ortho effect, bromine at ortho position was replaced with a methoxy or methyl group. The requisite ortho-methoxy/methyl phenyl allylic alcohols \(\mathbf{4 p} / \mathbf{4 q}\) was synthesized by the nucleophilic addition of 1.0 M vinylmagnesium bromide to its corresponding orthomethoxy/methyl benzaldehydes \(\mathbf{5 p} / \mathbf{5 q} .{ }^{66,67}\) Addition of vinylmagensium bromide was
carried out at \(0{ }^{\circ} \mathrm{C}\) and then slowly allowed to reach rt and stirred for 1.5 h . The secondary allylic alcohols \(\mathbf{4 p} / \mathbf{4 q}\) were obtained in excellent yields (90-95\%, Table II.5).

Table II.5: Synthesis of 2-methoxy/methyl phenyl allylic alcohols \(\mathbf{4 p} / \mathbf{4 q}\) from the corresponding 2-methoxy/methyl benzaldehydes 5p/5q.
Entry \({ }^{\text {a }}\)
\({ }^{a}\) Reaction conditions: All the reactions were carried out with 2-methoxy/methyl benzaldehyde \(\mathbf{5 p} / \mathbf{5 q} 10\) \(\mathrm{mmol}, 0.5 \mathrm{M}\) in THF. \({ }^{b}\) Isolated yields of chromatographically pure products.

Finally, to better understand the nature of steric and electronic factors that influence the selective formation of \(\beta\)-aryl allylic alcohols \(\mathbf{6}\), we further performed the reaction by choosing 2-methoxy/methyl benzaldehydes \(\mathbf{5 p} / \mathbf{5 q}\) as coupling partners. As expected, the reaction favors the regio- and stereoselective formation of \(\beta\)-aryl allylic alcohols 6 as major products along with the \(\beta\)-aryl carbonyls 7 as minor products (Tables II. 6 and II.7). This can be justified based on the relatively smaller size of 2methoxy/methyl substituents when compared to that of bromo one, that might slightly favors the formation of Jeffery-Heck product.

Table II.6: [Pd]-catalyzed reaction of 1-(2-methoxyphenyl)prop-2-en-1-ol \(\mathbf{4 p}\) with iodobenzenes 5a-5f, and 2-bromobenzaldehyde 5h to furnish \(\beta\)-aryl allylic alcohol 6pa\(\mathbf{6 p h}\) and \(\beta\)-aryl carbonyls 7pa-7ph.

\({ }^{a}\) Reaction conditions: All the reactions carried out with 1-(2-methoxyphenyl)prop-2-en-1-ol 4p (100 mg, \(0.60 \mathrm{mmol}), 0.30 \mathrm{M} \mathrm{CH}_{3} \mathrm{CN} .{ }^{b}\) Yields in the parentheses are isolated yields of chromatographically pure products.

Figure II.6.2: \({ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})\) spectrum of \(\mathbf{7 p e}\) in \(\mathrm{CDCl}_{3}\)
The structure of \(\beta\)-aryl carbonyl 7pe was confirmed by IR and NMR data analysis. The presence of the strong absorption band in IR spectrum at \(1676 \mathrm{~cm}^{-1}\) because of the \(\mathrm{C}=\mathrm{O}\) stretch indicated the formation of the \(\beta\)-aryl carbonyl 7pe. In the \({ }^{1} \mathrm{H}\)-NMR spectrum (Figure II.6.1), doublet of a doublet at \(\delta 7.69\) having \(J=7.7\) and 1.5 Hz was due to one aromatic proton, doublet at \(\delta 7.52\) having \(J=7.7 \mathrm{~Hz}\) was due to one aromatic proton, doublet of a doublet doublets at \(\delta 7.44\) having \(J=8.5,7.7\) and 1.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.27\) having \(J=7.7\) and 7.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.22\) having \(J=7.5\) and 7.2 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.05\) having \(J=8.0\) and 7.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 6.99\) having \(J=7.5\) and 7.5 Hz was due to one aromatic proton, doublet at \(\delta 6.94\) having \(J=8.0 \mathrm{~Hz}\) was due to one aromatic proton, singlet at \(\delta 3.86\) was due to three protons of methoxy group and the presence of two individual triplets at \(\delta 3.32\) and 3.14 ppm having \(J=7.5 \mathrm{~Hz}\) and \(J=7.5\) Hz were due to methylene group protons, elucidated the structure of \(\beta\)-aryl carbonyl 7pe. In addition to it, 17 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.6.2) in which \(\delta 201.2\) indicates the \(\mathrm{C}=\mathrm{O}\) group carbon, four aromatic quaternary carbon resonates at \(\delta\)
158.5, \(140.9,128.1\) and 124.4 , the presences eight aromatic methine carbons resonates at \(\delta 133.4,132.7,130.6,130.3,127.6,127.4,120.6\) and 111.4 , the presence of \(\delta 55.5\) was due to methoxy group carbon and the presence of \(\delta 43.4\) and 30.9 ppm were due to two methylene group carbons, elucidated the structure of \(\beta\)-aryl carbonyl 7pe. The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{BrNaO}_{2}\right]^{+}=340.0148\) in the mass spectrum further established the structure of \(\beta\)-aryl carbonyl 7pe.

The structure of \(\beta\)-aryl allylic alcohol 6qe was confirmed by IR and NMR data analysis. Broad absorption band at \(3325 \mathrm{~cm}^{-1}\) because of the OH stretching in the IR spectrum indicated the formation of the \(\beta\)-aryl allylic alcohol 6qe. In the \({ }^{1} \mathrm{H}\)-NMR spectrum (Figure II.7.1), the presence of doublet at \(\delta 7.51\) having coupling constant \(J=8.3 \mathrm{~Hz}\) was due to two aromatic protons, doublet at \(\delta 7.45\) having coupling constant \(J=8.3 \mathrm{~Hz}\) was due to one aromatic proton, a multiplet in the region of \(\delta 7.30-7.10\) was due to four aromatic protons, doublet of a doublet at \(\delta 7.06\) having \(J=8.0 \mathrm{~Hz}\) was due to one aromatic proton, the presence of doublet at \(\delta 7.00\) having coupling constant \(J_{\text {trans }}=15.8 \mathrm{~Hz}\) was due to olefinic methine group proton, doublet of a doublet at \(\delta 6.24\) having \(J_{\text {trans }}=15.8 \mathrm{~Hz}\) and \(J=6.3 \mathrm{~Hz}\) was due to olefinic methine group proton, doublet at \(\delta 5.58\) having \(J=6.3 \mathrm{~Hz}\) was due to benzylic methine proton, singlet at \(\delta 2.38 \mathrm{ppm}\) was due to three protons of methyl and br. s at \(\delta 2.22\) was due to hydroxyl proton illustrated the structure of the structure of \(\beta\)-aryl allylic alcohol \(\mathbf{6 q e}\). In addition to it, 16 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.7.2) in which four aromatic quaternary carbon resonates at \(\delta 140.3,136.5,135.3\) and 123.7 , the presence of 10 methine carbons at \(\delta 133.7,132.8,130.6,129.3,128.9,127.7,127.4,127.2,126.4\) and 125.8 were due to eight aromatic methine carbons and two olefinic methine carbons, presence of \(\delta 71.7\) was due to benzylic methine carbon and \(\delta 19.2 \mathrm{ppm}\) was due to methyl group carbon, illustrated the structure of the structure of \(\beta\)-aryl allylic alcohol \(\mathbf{6 q e}\). The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{BrNaO}\right]^{+}=325.0198\) in the mass spectrum further established the structure of \(\beta\)-aryl allylic alcohol 6qe.

Table II.7: [Pd]-catalyzed reaction of 1-(2-methylphenyl)prop-2-en-1-ol \(\mathbf{4 q}\) with iodobenzenes 5a-5f to furnish \(\beta\)-aryl allylic alcohols 6qa-6qf and \(\beta\)-aryl carbonyls 7qa7 qf.
(20)

The structure of \(\beta\)－aryl carbonyl 7qe was further confirmed by IR and NMR data analysis．Presence of strong absorption band at \(1684 \mathrm{~cm}^{-1}\) due to \(\mathrm{C}=\mathrm{O}\) stretch of the group IR spectrum indicated the formation of the \(\beta\)－aryl carbonyl 7qe．In the \({ }^{1} \mathrm{H}-\mathrm{NMR}\)
spectrum (Figure II.8.1), the presence of doublet at \(\delta 7.53\) having \(J=7.5 \mathrm{~Hz}\) was due to one aromatic proton, doublet at \(\delta 7.43\) having \(J=7.8 \mathrm{~Hz}\) was due to one aromatic proton, doublet of a doublet at \(\delta 7.25\) having \(J=7.2\) and 7.0 Hz was due to one aromatic proton, the presence of doublet of a doublet at \(\delta 7.18\) having \(J=7.5\) and 1.3 Hz was due to one aromatic proton, doublet at \(\delta 7.13\) having \(J=7.3 \mathrm{~Hz}\) was due to one aromatic proton, the presence of doublet of a doublet at \(\delta 7.12\) having \(J=7.3\) and 7.3 Hz was due to two aromatic protons, doublet of a doublet at \(\delta 6.96\) having \(J=7.8\) and 7.3 Hz was due to one aromatic proton, the presence of two individual triplets at \(\delta 3.13\) having \(J=7.8 \mathrm{~Hz}\) and at \(\delta 3.05 \mathrm{ppm}\) having \(J=7.8 \mathrm{~Hz}\) were due to methylene protons, elucidated the structure of \(\beta\)-aryl carbonyl 7qe. In addition to it, in 17 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.8.2) in which the presence of \(\delta 202.8\) indicates the \(\mathrm{C}=\mathrm{O}\) group carbon, four quaternary carbon resonates at \(\delta 140.4,138.2,137.5\) and 124.3 were due to four aromatic carbons, the presence of eight aromatic methine carbons resonates at \(\delta 132.8\), \(131.9,131.3,130.7,128.5,127.9,127.5\) and 125.6 , the presence of \(\delta 41.2\) and 30.9 were due to two methylene group carbons and \(\delta 21.3 \mathrm{ppm}\) was due to methyl group carbon, elucidated the structure of \(\beta\)-aryl carbonyl 7qe. The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{BrNaO}\right]^{+}=325.0198\) in the mass spectrum further established the structure of \(\beta\)-aryl carbonyl 7qe.

The reason for high selectivity for the formation of \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) in case of ortho-bromo substituent can be explained based on the following factors of bond lengths and polarization effects: (i) the C-Br bond length ( \(1.94 \AA\) ) is longer than C-C ( \(1.54 \AA\) ) and C-O ( \(1.43 \AA\) ) bond lengths, therefore bromine is far away from its parent aromatic ring and becomes close to [Pd]-species at C-2, which might exert some steric strain and thus restrict the rotation about \(\mathrm{C}_{1}-\mathrm{C}_{2}\) bond. (ii) The other reason might be due to the chelating capacity bromo substituent to form complex with Pd-species at C-2 carbon due to its ligation ability and high polarizability which could restrict the rotation, thus furnishing the desired \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) as a predominant product (Scheme II.16).

A plausible mechanistic route for the formation of \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) is predicted as shown in Scheme I.16. The first is the oxidative addition in which \(\mathrm{Pd}(\mathrm{II})-\) catalyst inserts into Ar-X bond resulting in the formation of the intermediate 8. Now, the addition of aryl palladium intermediate \(\mathbf{8}\) to both faces of double bond of the allylic alcohol 4 would furnish \(\operatorname{syn}-(\mathbf{9 a})\) and anti-(9b) intermediates with respect to the hydroxyl group. At this stage, two pathways for the \(\beta\)-hydride-PdX elimination might be possible. Despite the fact that syn- \(\beta\)-hydride-PdX elimination seems feasible in case of intermediate \(\mathbf{9 b}\), it might be confined due to the bulky nature of the benzylic alcohol part. Therefore, the rotation around \(\mathrm{C}_{1}-\mathrm{C}_{2}\) bond could be confined in both intermediates 9a and 9b, respectively. However, to the direction of minimal eclipsed interaction, the rotation of \(120^{\circ}\) around \(\mathrm{C}_{2}-\mathrm{C}_{3}\) bond of \(\mathbf{9 a}\) and \(\mathbf{9 b}\), which led to the formation of intermediates 9c and 9d respectively. Ultimately, the catalytic cycle completed by syn-\(\beta\)-hydride-PdX elimination from both 9c and 9d furnishes the same \(\beta\)-aryl allylic alcohol as product 6 (Scheme II.16).

Scheme II. 16

\section*{II.3.2. Sequential one-pot approach for the synthesis of 1,3-dihydroisobenzofurans} via [Pd]-catalysis

Significantly, the above method enabled us with interesting \(\beta\)-aryl allylic alcohols 6 with dense functionality on either of the aromatic rings. \({ }^{9 b}\) Amongst the \(\beta\)-aryl allylic alcohols \(\mathbf{6}\), those with aldehyde functionality on the aromatic ring appears to be the potential synthetic precursor for the synthesis of oxygen containing heterocyclic compounds. In this regard, we envisioned a short and efficient synthesis of interesting cyclic ethers such as benzoxepines \(\mathbf{1 2}\) or 1,3-dihydroisobenzofurans \(\mathbf{1 1}\) which could be achieved by employing reduction and acid mediated intramolecular cyclization protocol on \(\beta\)-aryl allylic alcohols 6. According to our retrosynthetic analysis, the possible benzoxepine \(\mathbf{1 2}\) or 1,3-dihydroisobenzofurans \(\mathbf{1 1}\) can be obtained by acid mediated cyclization of diol \(\mathbf{1 0}\), which in turn can be synthesized easily from reduction of the coupled products 6 (Scheme II.17).

Scheme II. 17

We thought that the process can be made more efficient by developing a sequential one-pot method for the direct synthesis of diol \(\mathbf{1 0}\) starting from aryl allylic alcohols 4 and 2-bromobenzaldehydes \(\mathbf{5 h} \mathbf{- 5 0}\). This can be achieved by the [Pd]-
catalysed coupling for the formation of \(\beta\)-aryl allylic alcohols \(\mathbf{6}\) and in-situ reduction of the aldehyde functionality. Thus, the [Pd]-catalyzed coupling of 2-bromobenzaldehyde \(\mathbf{5 j}\) with the aryl allylic alcohol \(\mathbf{4 h}\) followed by \(\mathrm{NaBH}_{4}\) induced in-situ reduction of the coupled product aldehyde \(\mathbf{6 h j}\) gave the desired diol 10hj in very good yield (Scheme II.18). The idea behind this hypothesis is to minimize the number of steps, to minimize waste and to improve the overall yield of the reaction over the step-wise approach. However, the diol \(\mathbf{1 0}\) could not be characterized due to its insolubility in \(\mathrm{CDCl}_{3}\) and hence, proceeded to the next reaction.

5j

10hj

\section*{Scheme II. 18}

With the required diol \(\mathbf{1 0 h j}\) in hand, next the acid promoted cyclization was explored under different set of conditions and the results are summarized in the Table II.8. Thus, the reaction when carried out with the Lewis acid \(\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right)\) at \(0{ }^{\circ} \mathrm{C}\) and as well as at \(-10^{\circ} \mathrm{C}\) led to the decomposition of the product (Table II.8, entries 1 and 2). Therefore, further decreasing the temperature to \(-20^{\circ} \mathrm{C}\) the product \(\mathbf{1 1 h j}\) was furnished in poor yield ( \(30 \%\), Table II.8, entry 3). Interestingly, further decrease of temperature \(\left(-40{ }^{\circ} \mathrm{C}\right)\), gave the product \(\mathbf{1 1 \mathbf { h j }}\) in excellent yield ( \(95 \%\), Table II.8, entry 4 ). On the other hand, exploring the reaction with different acids such as protic acid ( \(p\)-TSA) or Lewis acid \(\left(\mathrm{AlCl}_{3}\right)\) resulted the product \(\mathbf{1 1 h j}\) in moderate to very good yield (Table II.8, entries 5-7), whereas the reaction with \(\mathrm{H}_{2} \mathrm{SO}_{4}\), gave the product in poor yield ( \(20 \%\), Table II.8, entries 8).

Figure II. 9
Having established the reaction conditions for the synthesis of 1,3dihydroisobenzofuran 11, we thought that the method can still be made more efficient by performing cyclization directly on crude diol \(\mathbf{1 0}\) without the column purification. Interestingly, the reaction was found to be smooth on the crude diol 10 (i.e., on the crude diol which was obtained the after the work-up followed by concentration under reduced pressure) and final product was obtained in \(48 \%\) overall yield (Scheme II.19). The structure of the cyclic ether 11hj was confirmed from the spectroscopic data. \({ }^{1} \mathrm{H}-\mathrm{NMR}\) data unambiguously confirmed
the geometry of the double bond as trans one by calculating the coupling constant ( \(J=15.5\) to 15.6 Hz , see; experimental section). Therefore, the other possibility for the formation of seven membered cyclic ether \(\mathbf{1 2 h} \mathbf{j}\) was ruled out, because it must contain cis double bond. In addition, the formation of five membered cyclic ether \(\mathbf{1 1 h} \mathbf{j}\) is geometrically favoured over the seven membered one.

Scheme II. 19
Now with the optimized reaction conditions in hand, to check the scope and limitations of the method, we have investigated this sequential one-pot method on various 2-bromobezaldehydes \(\mathbf{5 h} \mathbf{- 5 0}\) in conjuction with aryl allylic alcohols \(\mathbf{4 h} \mathbf{- 4 0}\). Quite interestingly, the method was amenable on various systems possessing dense functionalities and furnished the products in moderate yields (41-55\%) as summarized in Table II.9. It is worth mentioning that although the yields of the cyclic ether products \(\mathbf{1 1}\) are moderate, it actually represents the overall yield of three individual reactions. Therefore, each step contributes to at least \(75 \%\) yield and hence the method still stands efficient.

\({ }^{a}\) Reaction conditions: All the reactions were carried out with 2-bromobenzadehydes 5 ( 0.50 mmol ). \({ }^{b}\) Isolated yields of chromatographically pure products. for compounds \(\mathbf{1 1 h h} \mathbf{- 1 1 n n}\) the first alphabet letter
refers to the allylic alcohol part \(\mathbf{4 h} \mathbf{- 4 o}\), whereas the second letter indicates the aromatic ring coming from the bromo aldehyde \(\mathbf{5 h - 5 0}\).

Figure II.10.1: \({ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})\) spectrum of \(\mathbf{1 1} \mathbf{h j}\) in \(\mathrm{CDCl}_{3}\)

Figure II.10.2: \({ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})\) spectrum of \(\mathbf{1 1 h j}\) in \(\mathrm{CDCl}_{3}\)
The structure of 1,3-dihydroisobenzofuran \(\mathbf{1 1 h} \mathbf{j}\) was confirmed by IR and NMR data analysis. The absence of broad absorption band was due to OH stretching and the
presence of strong absorption band at \(1611 \mathrm{~cm}^{-1}\) was due to the \(\mathrm{C}=\mathrm{C}\) stretch indicated the formation of 1,3-dihydroisobenzofuran \(\mathbf{1 1 h} \mathbf{j}\). In the \({ }^{1} \mathrm{H}\)-NMR spectrum (Figure II.10.1), the presence of doublet of a doublet at \(\delta 7.54\) having \(J=7.8\) and 1.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.51\) having \(J=7.8\) and 1.5 Hz was due to one aromatic proton, doublet of a doublet at \(\delta 7.22\) having \(J=7.8\) and 1.0 Hz was due to one aromatic proton, a multiplet in the region of \(\delta 7.15-7.00\) was due to two aromatic protons and one olefinic proton, doublet of a doublet at \(\delta 6.83\) having \(J=8.3\) and 2.4 Hz was due to one aromatic proton, doublet at \(\delta 6.78\) having \(J=8.3 \mathrm{~Hz}\) was due to one aromatic proton, doublet of a doublet at \(\delta 6.19\) having \(J=16.1\) and 7.8 Hz was due to olefinic methine group proton, doublet at \(\delta 5.76\) having \(J=7.8 \mathrm{~Hz}\) was due to benzylic methine group proton, doublet of a doublet at \(\delta 5.19\) having \(J=12.0\) and 2.0 Hz was due to benzylic methylene group proton, doublet at \(\delta 5.11\) having \(J=12.0 \mathrm{~Hz}\) was due to benzylic methylene group proton, the presence of singlet \(\delta 3.81\) was due to methoxy group three protons elucidated the structure of 1,3-dihydroisobenzofuran 11hj. In addition to it, 16 signals appeared in \({ }^{13} \mathrm{C}\)-NMR spectrum (Figure II.9.2) in which five quaternary carbon resonates at \(\delta 159.9,140.8,136.4132 .7\) and 123.8 were due to five aromatic carbons, the presence of nine methine carbon resonates at \(\delta\) at \(\delta 132.9,132.3\), \(130.3,129.0,127.4,127.3,122.7,113.7\) and 106.3 were due to seven aromatic methane group carbons and two olefin methane group protons, \(\delta 84.7\) was due to benzylic methine group carbon, \(\delta 72.8\) was due to benzylic methylene group carbon and \(\delta 55.5\) ppm was due to methoxy group carbon elucidated the structure of 1,3dihydroisobenzofuran 11hj. The presence of the \([\mathrm{M}+\mathrm{Na}]^{+}\)peak at \(\mathrm{m} / \mathrm{z}\) \(\left[\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{BrNaO}_{2}\right]^{+}=353.0164\) in the mass spectrum further established the structure of 1,3-dihydroisobenzofuran 11hj.

After the successful synthesis of 1, 3-dihydroisobenzofurans 11, we planned to increase the scope of this protocol by employing the allylic alcohols possessing a methyl/methoxy group \(\mathbf{4 q} / \mathbf{4}\) p in the ortho position. During the sequential one-pot approach, we observed the formation of the regular Jeffery-Heck product along with the

Mizoroki-Heck product. \({ }^{9 b}\) This (Jeffery-Heck product) interfered in the further steps and hindered the isolation of clean products. Thus, we proceeded in a step-wise approach and achieved the targeted 1, 3-dihydroisobenzofurans 11qh and 11ph in a moderate overall yield ( \(47 \%\) and \(52 \%\) ). It is worth mentioning that in these cases, we were also able to characterize the diol 10 (Scheme II.20).

\section*{Scheme II. 20}

\section*{II.4. CONCLUSIONS:}

We have developed an efficient method for synthesis of \(\beta\)-aryl allylic alcohols in highly regio- and stereoselective manner under [Pd]-catalysis using aryl iodides or 1-bromo-2-iodobenzenes or 2-bromobenzaldehydes as coupling partners to various allylic alcohols. As a consequence, wide ranges of \(\beta\)-aryl allylic alcohols were accomplished. This observation was unanticipated under traditional Jeffery-Heck conditions without the help of silver salt. This method is expeditious and amenable functioned consistently on different systems of simple to electron rich aromatic moieties and furnished the products with dense functionality on the aromatic rings. Significantly, based on this method, an efficient sequential one-pot process was developed for the synthesis of iso-
benzofurans, an important core structure present in many biologically active natural products (Scheme II.21).

Scheme II. 21

\section*{II.5. EXPERIMENTAL SECTION:}

IR spectra were recorded on a Bruker Tensor 37 (FT-IR) spectrophotometer. \({ }^{1} \mathrm{H}\) NMR spectra were recorded on Bruker Avance \(400(400 \mathrm{MHz})\) spectrometer at 295 K in \(\mathrm{CDCl}_{3}\); chemical shifts ( \(\delta\) in ppm) and coupling constants ( \(J\) in Hz) are reported in standard fashion with reference to either internal standard tetramethylsilane (TMS) ( \(\delta_{\mathrm{H}}\) \(=0.00 \mathrm{ppm})\) or \(\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}}=7.25 \mathrm{ppm}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}\) spectra were recorded on Bruker Avance \(400(100 \mathrm{MHz})\) spectrometer at RT in \(\mathrm{CDCl}_{3}\); chemical shifts ( \(\delta\) in ppm) are reported relative to \(\mathrm{CHCl}_{3}\left[\delta_{\mathrm{C}}=77.00 \mathrm{ppm}\right.\) (central line of triplet)]. In the \({ }^{13} \mathrm{C}-\mathrm{NMR}\), the nature of carbons \(\left(\mathrm{C}, \mathrm{CH}, \mathrm{CH}_{2}\right.\) and \(\left.\mathrm{CH}_{3}\right)\) was determined by recording the DEPT135 spectra, and is given in parentheses and noted as \(s=\operatorname{singlet}\) (for C ), \(\mathrm{d}=\operatorname{doublet}\) (for \(\mathrm{CH}), \mathrm{t}=\) triplet \(\left(\right.\) for \(\left.\mathrm{CH}_{2}\right)\) and \(\mathrm{q}=\) quartet (for \(\left.\mathrm{CH}_{3}\right)\). In the \({ }^{1} \mathrm{H}-\mathrm{NMR}\), the following abbreviations were used throughout: \(\mathrm{s}=\) singlet, \(\mathrm{d}=\) doublet, \(\mathrm{t}=\) triplet, \(\mathrm{q}=\) quartet, qui \(=\) quintet, \(\mathrm{m}=\) multiplet and br. \(\mathrm{s}=\) broad singlet, septd \(=\) septet of doublets. The assignment of signals was confirmed by \({ }^{1} \mathrm{H},{ }^{13} \mathrm{C}\) CPD and DEPT spectra. High-
resolution mass spectra (HR-MS) were recorded on an Agilent 6538 UHD Q-TOF using multimode source. The X-ray crystal structure data was measured using Oxford Super Nova instrument. All small scale dry reactions were carried out using the standard syringe-septum technique. Reactions were monitored by TLC on the silica gel using a mixture of petroleum ether and ethyl acetate as eluents. Reactions were generally run under an argon or nitrogen atmosphere. All solvents were distilled to prior use; petroleum ether with a boiling range of 60 to \(80^{\circ} \mathrm{C}\), diethyl ether, dichloromethane (DCM), ethyl acetate, toluene (with purity \(99 \%\) ), THF (with purity \(99 \%\) ), acetonitrile (with purity \(99.9 \%\) ), purchased from locally available commercial sources were used. All aromatic aldehydes (with purity 98\%), bromine (with purity 99\%), iodine (with purity \(99 \%\) ), \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}\) (with purity \(99 \%\) ), \(\mathrm{Pd}(\mathrm{OAc})_{2}\) (with purity \(98 \%\) ), 3-iodoanisole (with purity \(99 \%\) ), 2-bromoiodobenzene (with purity \(99 \%\) ), \(\mathrm{NaBH}_{4}\) (with purity \(99 \%\) ), \(\mathrm{K}_{2} \mathrm{CO}_{3}\) (with purity \(99 \%\) ), and \(\mathrm{NaHCO}_{3}\) (with purity \(99.5 \%\) ) were purchased from Sigma-Aldrich, whereas vinylmagnesium bromide (with purity \(99 \%\) ), \(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\) (with purity \(\mathrm{XX} \%\) ), iodobenzene (with purity \(99 \%\) ) and \(\mathrm{Cs}_{2} \mathrm{CO}_{3}\) (with purity \(99 \%\) ) were purchased from other commercial sources and used as received. The bases \(\mathrm{K}_{2} \mathrm{CO}_{3}\), \(\mathrm{NaHCO}_{3}\) and \(\mathrm{Cs}_{2} \mathrm{CO}_{3}\) were dried at \(150-170{ }^{\circ} \mathrm{C}\) over oil bath. Diethyl ether and toluene were dried over sodium/ benzophenone. DCM, DCE, DMF and DMA dried over calcium hydride. Acetonitrile dried over \(\mathrm{P}_{2} \mathrm{O}_{5}\). Acme's silica gel ( \(60-120\) mesh) was used for column chromatography (approximately 20 g per one gram of crude material).

The following 2-bromobenzaldehydes \(\mathbf{5 h} \mathbf{- 5 o}\) (except 2-bromobenzaldehyde) were synthesized using literature reported bromination of corresponding benzaldehydes. \({ }^{42}\) 1-(2-bromophenyl)prop-2-en-1-ol 4h, \({ }^{69}\) 1-(2-methoxyphenyl)prop-2-en-1-ol (4p), \({ }^{66}\) and 1-(2-methylphenyl)prop-2-en-1-ol (4q), \({ }^{67}\) and were synthesized using literature reported procedure from corresponding 2 -bromobenzaldehyde \(\mathbf{5 h}\), 2methoxybenzaldehyde 5p and 2-methylbenzaldehyde 5q. 4-iodo-1,2-dimethoxybenzene 5c, 1-iodo-2,3,4-trimethoxybenzene 5d and 2-bromo-1-iodo-4-methoxybenzene \(\mathbf{5 f}\) were synthesized using literature reported procedure from corresponding starting material. \({ }^{43}\)

\section*{II.5.1 Synthesis of \(\beta\)-aryl allylic alcohols:}

General procedure for the synthesis of 2-bromo aryl allylic alcohol 4h-4o, 2methoxy phenyl allylic alcohol 4 p and 2-methyl phenyl allylic alcohol 4q (GP-1):

To a magnetically stirred solution of 2-bromobenzaldehyde \(\mathbf{5}\) or 2methoxybenzaldehyde \(\mathbf{5 p}\) or 2-methylbenzaldehyde \(\mathbf{5 q}(10 \mathrm{mmol})\) in a THF \((20 \mathrm{~mL})\) in a round bottom flask at \(0{ }^{\circ} \mathrm{C}\) under nitrogen atmosphere was added 1.0 M vinylmagnesium bromide solution ( \(20 \mathrm{~mL}, 20 \mathrm{mmol}, 1.0 \mathrm{M}\) in THF) and the resultant reaction mixture was slowly allowed to reach room temperature and stirred for 1.5 h . The reaction mixture was quenched with saturated aqueous \(\mathrm{NH}_{4} \mathrm{Cl}\) solution and extracted with ethyl acetate \((3 \times 20 \mathrm{~mL})\). The organic layer was washed with saturated

NaCl solution, dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\) and filtered. Evaporation of the filtrate under reduced pressure and purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the product 2-bromo aryl allylic alcohol \(\mathbf{4 h}\) - \(\mathbf{4 o}\) ( \(80-95 \%\) ) or 2-methoxy phenyl allylic alcohol \(\mathbf{4 p}(90 \%)\) or 2methyl phenyl allylic alcohol \(\mathbf{4 q}\) (95\%).

4h
1-(2-Bromophenyl)prop-2-en-1-ol (4h): GP-1 carried out with 2-bromobenzaldehyde \(\mathbf{5 h}(1.85 \mathrm{~g}, 10 \mathrm{mmol})\), in THF ( 20 mL ), was added 1.0 M vinylmagnesium bromide ( 20 \(\mathrm{mL}, 20 \mathrm{mmol}, 1.0 \mathrm{M}\) in THF). Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate \(97: 3\) to \(90: 10\) ) furnished the product \(\mathbf{4 h}\) \((1.7 \mathrm{~g}, 80 \%)\) as pale yellow viscous liquid. [TLC control \(R_{f}(\mathbf{5 h})=0.75, R_{f}(\mathbf{4 h})=0.70\) (petroleum ether/ethyl acetate 95:05, UV detection)].

4i
1-[5-(Benzyloxy)-2-bromophenyl]prop-2-en-1-ol (4i): GP-1 carried out with 2bromobenzaldehyde \(5 \mathbf{5 i}(2.91 \mathrm{~g}, 10 \mathrm{mmol})\), in THF ( 20 mL ), was added 1.0 M vinylmagnesium bromide ( \(20 \mathrm{~mL}, 20 \mathrm{mmol}, 1.0 \mathrm{M}\) in THF). Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate 90:10 to 80:20) furnished the product \(\mathbf{4 i}(2.80 \mathrm{~g}, 88 \%)\) as pale yellow viscous liquid. [TLC control \(R_{f}(\mathbf{5 i})=0.60, R_{f}(\mathbf{4 i})=0.40\) (petroleum ether/ethyl acetate 90:10, UV detection)].

IR (MIR-ATR, 4000-600 \(\mathbf{~ c m}^{\mathbf{- 1}}\) ): \(v_{\max }=3371,3032,2920,1592,1571,1462\), 1291, 1380, 1291, 1233, 1163, 1010, 927, 736, \(697 \mathrm{~cm}^{-1}\).

Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate \(95: 5\) to \(90: 10\) ) furnished the product \(\mathbf{4 q}\) \((1.4 \mathrm{~g}, 95 \%)\) as pale yellow viscous liquid. [TLC control \(R_{f}(\mathbf{5 q})=0.50, R_{f}(\mathbf{4 q})=0.30\) (petroleum ether/ethyl acetate 80:20, UV detection)].

General procedure for \(\beta\)-arylation for the synthesis of product 6 (under conventional conditions) (GP-2):

In an oven dried round bottom flask under nitrogen atmosphere, were added \(\mathrm{Pd}(\mathrm{OAc})_{2}\) ( \(5 \mathrm{~mol} \%), \mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(0.20-0.67 \mathrm{mmol}), \mathrm{NaHCO}_{3}(0.40-1.34 \mathrm{mmol})\), aryl allyl alcohol 4 ( \(0.20-0.67 \mathrm{mmol}\) ) and aryl halide 5 ( \(0.24-0.80 \mathrm{mmol}\) ) followed by
acetonitrile ( 2 mL ). The resulted reaction mixture was stirred for 24 h at \(50^{\circ} \mathrm{C}\), then reaction mixture was quenched by addition of aq. \(\mathrm{NH}_{4} \mathrm{Cl}\) and extracted with ethyl acetate \((3 \times 10 \mathrm{~mL})\). The organic layer was dried over \(\mathrm{Na}_{2} \mathrm{SO}_{4}\) and filtered. Evaporation of the filtrate under reduced pressure and purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the \(\beta\)-arylated coupled products 6 (33-81\%).

\section*{General procedure for \(\boldsymbol{\beta}\)-arylation for the synthesis of product \(\mathbf{6}\) (under microwave irradiation conditions) (GP-3):}

In an oven dried microwave 10 ml vial under nitrogen atmosphere, were added \(\mathrm{Pd}(\mathrm{OAc})_{2}(5 \mathrm{~mol} \%), \mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(0.20-0.67 \mathrm{mmol}), \mathrm{NaHCO}_{3}(0.40-1.34 \mathrm{mmol})\), aryl allylic alcohol 4 ( \(0.20-0.67 \mathrm{mmol})\) and aryl halide \(5(0.24-0.80 \mathrm{mmol})\) followed by acetonitrile ( 2 mL ) and sealed the vial. The resulted reaction mixture was irradiated under the microwave ( \(250 \mathrm{~W}, 50^{\circ} \mathrm{C}\) ) for 90 min . Then, the reaction mixture was quenched by an addition of aq. \(\mathrm{NH}_{4} \mathrm{Cl}\) and extracted with ethyl acetate \((3 \times 10 \mathrm{~mL})\). The organic layer was dried over \(\mathrm{Na}_{2} \mathrm{SO}_{4}\) and filtered. Evaporation of the filtrate under reduced pressure and the purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the \(\beta\)-arylated coupled products 6 (29-86\%).

(E)-1-(2-Bromophenyl)-3-phenylprop-2-en-1-ol (6ha): GP-2 was carried out on bromoaryl allyl alcohol \(4 \mathrm{~h}(100 \mathrm{mg}, 0.47 \mathrm{mmol})\) with \(\mathrm{Pd}(\mathrm{OAc})_{2}(5.2 \mathrm{mg}, 5 \mathrm{~mol} \%)\), \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(106 \mathrm{mg}, 0.47 \mathrm{mmol}), \mathrm{NaHCO}_{3}(78 \mathrm{mg}, 0.94 \mathrm{mmol})\), iodobenzene 5a (114 \(\mathrm{mg}, 0.56 \mathrm{mmol})\) in dry acetonitrile ( 2 mL ), and the reaction mixture was heated at \(50^{\circ} \mathrm{C}\) for 24 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate \(95: 5\) to \(80: 20\) ) furnished the product \(\mathbf{6 h a}\) ( \(110 \mathrm{mg}, 82 \%\) ), (followed GP-3 under microwave irradiation conditions, \(115 \mathrm{mg}, 86 \%\) ) as brown viscous liquid.
[TLC control \(R_{f}(\mathbf{4 h})=0.30, R_{f}(\mathbf{6 h a})=0.20\) (petroleum ether/ethyl acetate \(90: 10\), UV detection)].

\section*{II.5.2 Synthesis of 1,3-dihydroisobenzofurans:}

General procedure-4 for the synthesis of 1,3-dihydroisobenzofurans (11hh-11nn):
In an oven dried Schlenk under nitrogen atmosphere, were added \(\mathrm{Pd}(\mathrm{OAc})_{2}\) ( \(5 \mathrm{~mol} \%\) ), \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(0.50 \mathrm{mmol}), \mathrm{NaHCO}_{3}(1 \mathrm{mmol})\), 2-bromobenzaldehyde \(\mathbf{5 h}-\mathbf{5 o}\) ( 0.50 mmol ) and bromo aryl allylic alcohol \(\mathbf{4 h}-\mathbf{4 o}(0.60 \mathrm{mmol})\) followed by dry acetonitrile \((4 \mathrm{~mL})\). The resulted reaction mixture was stirred for 24 h at \(80^{\circ} \mathrm{C}\). The reaction was allowed the reaction to \(0{ }^{\circ} \mathrm{C}\) where added \(\mathrm{NaBH}_{4}(1.50 \mathrm{mmol})\), stirred for two hours at rt . The reaction mixture was quenched with saturated aq. \(\mathrm{NH}_{4} \mathrm{Cl}\) solution and extracted with ethyl acetate \((3 \times 20 \mathrm{~mL})\). The organic layer was washed with saturated NaCl solution, dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\) and concentrated under reduced pressure. Traces of solvents were removed under high vacuum. To the above crude, dry DCM 20 mL was added. The reaction was cooled to \(-40{ }^{\circ} \mathrm{C}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(2.5 \mathrm{mmol})\) was added. The reaction was then stirred for 2 h at the same temperature. The reaction mixture was then quenched with saturated aqueous \(\mathrm{NaHCO}_{3}\) solution and the aqueous layer was extracted with \(\mathrm{DCM}(3 \times 20 \mathrm{~mL})\). The organic layers were dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\), filtered, and concentrated under reduced pressure. Purification of the residue on a silica gel
column chromatography (petroleum ether/ethyl acetate) furnished the product 11 hh 11nn (40\%-55\%).

11hh
1-[(E)-2-(2-Bromophenyl)vinyl]-1,3-dihydro-2-benzofuran (11hh): Reaction was carried out according to the GP-4 by adding \(\mathrm{Pd}(\mathrm{OAc})_{2}(5.6 \mathrm{mg}, 0.025 \mathrm{mmol})\), \(\mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(114.0 \mathrm{mg}, \quad 0.50 \mathrm{mmol}), \mathrm{NaHCO}_{3}(84.0 \mathrm{mg}, \quad 1.00 \mathrm{mmol})\), 2bromobenzaldehyde \(\mathbf{5 h}(93 \mathrm{mg}, 0.50 \mathrm{mmol})\) and bromo aryl allylic alcohol \(\mathbf{4 h}\) (128.0 \(\mathrm{mg}, 0.60 \mathrm{mmol}\) ) followed by acetonitrile ( 4 mL ). The resultant reaction mixture was stirred for 24 h at \(80^{\circ} \mathrm{C} . \mathrm{NaBH}_{4}(57.0 \mathrm{mg}, 1.50 \mathrm{mmol})\) was added at \(0{ }^{\circ} \mathrm{C}\) and stirred for 2 h at rt . Worked up the reaction, followed by dry DCM ( 20 mL ) addition and cooled the reaction to \(-40{ }^{\circ} \mathrm{C} . \mathrm{BF}_{3} . \mathrm{Et}_{2} \mathrm{O}(0.74 \mathrm{~mL}, 2.5 \mathrm{mmol})\) was added and stirred for 2 h . Purification of the residue on a silica gel column chromatography (petroleum ether) furnished the product \(11 \mathrm{hh}(83 \mathrm{mg}, 55 \%)\) as yellow viscous liquid. [TLC control \(R_{f}(\mathbf{5 h})=0.80, R_{f}(\mathbf{4 h})=0.70\) and \(R_{f}(\mathbf{1 1 h h})=0.85\) (petroleum ether/ethyl acetate \(95: 5\), UV detection)]

HR-MS (ESI'): m/z calculated for \(\left[\mathrm{C}_{20} \mathrm{H}_{21} \mathrm{BrNaO}_{5}\right]^{+}=[\mathrm{M}+\mathrm{Na}]^{+}: 443.0465\); found 443.0468 .

General procedure-5 for the synthesis of 1,3-dihydroisobenzofurans (11qh \& 11ph): In an oven dried Schlenk under nitrogen atmosphere, were added \(\mathrm{Pd}(\mathrm{OAc})_{2}\) (5 \(\mathrm{mol} \%), \mathrm{Bn}(\mathrm{Et})_{3} \mathrm{NCl}(0.50 \mathrm{mmol}), \mathrm{NaHCO}_{3}(1 \mathrm{mmol}), 2\)-bromobenzaldehydes \(\mathbf{5 h}(0.50\) \(\mathrm{mmol})\) and ortho-Methyl/Methoxy aryl allylic alcohol \(\mathbf{4 q} / \mathbf{4 p}(0.60 \mathrm{mmol})\) followed by dry acetonitrile ( 4 mL ). The resulted reaction mixture was stirred for 24 h at \(80^{\circ} \mathrm{C}\). The reaction mixture was quenched using saturated aq. \(\mathrm{NH}_{4} \mathrm{Cl}\) solution and compound was extracted in ethyl acetate, concentrated under reduced pressure. The aldehyde \(\mathbf{6 q h} / \mathbf{6 p h}\) was isolated by silica gel column chromatography (petroleum ether/ethyl acetate). The aldehyde \(\mathbf{6 q h} / \mathbf{6 p h}\) was subjected to \(0{ }^{\circ} \mathrm{C}\) and added \(\mathrm{NaBH}_{4}(1.50 \mathrm{mmol})\), stirred for two hours at rt . The reaction mixture was quenched with saturated aq. \(\mathrm{NH}_{4} \mathrm{Cl}\) solution and extracted with ethyl acetate \((3 \times 20 \mathrm{~mL})\). The organic layer was washed with saturated NaCl solution, dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\) and concentrated under reduced pressure. Traces of solvents removed under high vacuum, to the above crude dry DCM 20 mL
was added cooled the reaction to \(-40^{\circ} \mathrm{C}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(2.5 \mathrm{mmol})\) added, stir the reaction for 2 h at the same temperature. The reaction mixture was then quenched with saturated aqueous \(\mathrm{NaHCO}_{3}\) solution and the aqueous layer was extracted with \(\mathrm{DCM}(3 \times 20 \mathrm{~mL})\). The organic layers were dried over anhydrous \(\mathrm{Na}_{2} \mathrm{SO}_{4}\), filtered, and concentrated under reduced pressure. Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the products (11qh \& 11ph) (47-52\%).

(2E)-3-[2-(hydroxymethyl)phenyl]-1-(2-methylphenyl)prop-2-en-1-ol (10qh): GP-5 was carried out and the product 10qh ( \(65 \mathrm{mg}, 97 \%\) ) was furnished as yellow colored viscous liquid. [TLC control (petroleum ether/ethyl acetate 70:30, \(R_{f}(\mathbf{6 q h})=0.70\), \(R_{f}(\mathbf{1 0 q h})=0.30\) UV detection \(\left.)\right]\).

# CHAPTER III 

# DOMINO [Pd]-CATALYSIS: SYNTHESIS OF <br> BI-ARYL ACETYLENES 

## III. 1 INTRODUCTION:

Transition-metal catalyzed C-C bond forming reactions are considered to be an important tool in the arena of organic synthesis. Amongst Sonogashira reaction that involves palladium-copper catalyzed $\mathrm{Csp}^{2}$-Csp bond formation between terminal alkyne and aryl halide for the synthesis of di-substituted acetylenes. The Sonogashira reaction has been evidence as an efficient method for the synthesis of various alkynes. It has gained much significance in construction of complex molecules because of its electronic properties and linear geometry. ${ }^{70}$ In literature, molecules containing ( $Z$ )enediynes or related unsaturated framework are found to have potent antitumor,
antibiotic activity or contraceptive pill. Chiral molecules having propargylic stereo center are found to be much useful building blocks in the synthesis of natural products and pharmaceuticals and functional materials. ${ }^{71,72,73}$

Usually, this reaction was performed by using either $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$ or $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ as a catalyst and copper(I)-iodide as the co-catalyst. The most commonly used bases for this purpose are triethylamine, diethylamide and di-isopropylethylamine (Hünig's base). The solvents that are commonly employed in this reaction are benzene, toluene, THF, DMF, and dioxane and in some cases amine itself acts as a solvent when taken in excess amount. ${ }^{74}$

It is observed that sonogashira reaction requires copper salts as a co-catalyst and it involves in-situ generation of copper acetylide. These copper salts involves generally generate the Glaser coupling product as the byproduct upon exposure to oxidative agents or air, ${ }^{75}$ thus effecting the reaction course and yields of the bi-aryl acetylenes. Since these byproducts are usually difficult to separate, this side reaction is a major concern. Due to these reasons, preparation of terminal alkynes is very difficult or it is costly. On the other hand, copper acetylide is a potential explosive reagent; hence, the reaction is not environmental friendly. In literature, many alterations have been developed to improve the Sonogashira reaction such as the use of phase-transfer reaction conditions, ${ }^{76}$ performing the reaction in aqueous medium, ${ }^{77}$ solvent-free reaction conditions etc., ${ }^{78}$ but it still requires copper as a co-catalyst. Therefore, the reaction without the assistance of copper salt as co-catalyst would be the most significant method for the preparation of bi-aryl acetylenes.

## III. 2 BACKGROUND:

In the year 1975, three research groups independently developed a method for the synthesis of bi-aryl acetylenes 20 by Heck, ${ }^{79}$ Cassar ${ }^{80}$ Sonogashira and Hagihara ${ }^{81}$
(Scheme III.1). Heck's strategy was based on the known Mizoroki-Heck reaction and by using $\mathrm{Pd}(\mathrm{OAc})_{2}$ and $\mathrm{Ph}_{3} \mathrm{P}$ as a catalytic system and triethylamine as a base as well as a solvent, whereas Cassar's process involved the use of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ as a catalyst, sodium methoxide as a base and DMF as a solvent. Both methods generally required high temperature. At the same time, Sonogashira and Hagihara disclosed a method for the synthesis of bi-aryl acetylenes $\mathbf{2 0}$ by adding CuI as co-catalyst at room temperature involving short reaction time. Afterwards this method became popular and was known as Sonogashira coupling.

Scheme III. 1

Carmen Najera reported a microwave assisted strategy for the synthesis of disubstituted alkynes from aryl imidazol-1-ylsulfonates $\mathbf{4}$ and aryl-, alkyl- acetylenes $\mathbf{8}$ in aqueous medium without the assistance of copper co-catalyst. This method was successfully carried out in the presence of $0.5 \mathrm{~mol} \%$ of an oxime palladacycle as precatalyst 21 and 22, SPhos and hexadecyltrimethylammonium bromide (CTAB). Various di-substituted alkynes $\mathbf{2 0}$ have been prepared in poor to excellent yields in 30 mins short span of time (Scheme III.2). ${ }^{82}$

Scheme III. 2

Ryu et al. disclosed a novel copper-free Sonogashira coupling reaction for the synthesis of bi-aryl substituted acetylenes 20 by using ionic liquid ( $[\mathrm{BMIm}]\left[\mathrm{PF}_{6}\right]$ ) and the products were obtained in very good to excellent yields (Scheme III.3). ${ }^{83}$

## Scheme III. 3

Matthias Beller and co-workers presented a very convenient and novel strategy for the synthesis of bi-aryl acetylenes $\mathbf{2 0}$ directly from aromatic anisignals $\mathbf{5}$ and terminal aryl acetylene $\mathbf{8}$ by in-situ generated arenediazonium salts (Scheme III.4). ${ }^{84}$

Scheme III. 4

Liu et al. developed a rapid and quick access to bi-aryl acetylene $\mathbf{2 0}$ by copperfree [Pd]-catalyzed Sonogahira cross coupling of aryl chloride $\mathbf{3}$ and terminal aryl alkyne 8. The generality of this method was checked on various aryl chlorides 8 , which include electron-rich, electron-neutral, electron deficient and sterically hindered aryl chloride 8 (Scheme III.5). ${ }^{85}$

Scheme III. 5

Li and co-workers have also contributed to the copper and amine free mediated synthesis of di-substituted alkynes 20. It is [Pd]-catalyzed decarboxylative coupling reactions between alkynyl carboxylic acids $\mathbf{1 0}$ and benzyl halides $\mathbf{6}$ or aryl halides $\mathbf{1}, \mathbf{2}$ and $\mathbf{3}$ which lead to the formation of di-substituted alkynes 20 (Scheme III.6). ${ }^{86}$

Scheme III. 6

Yang and Wu developed an interesting methodology for executing di-substituted symmetrical as well as unsymmetrical acetylenes 20. It is a palladacycle mediated deacetonative Sonogashira coupling of aryl propargyl alcohols $\mathbf{1 3}$ with aryl chlorides $\mathbf{3}$, which furnished the di substituted bi-aryl acetylene products $\mathbf{2 0}$ in excellent yields (Scheme III.7). ${ }^{87}$

Scheme III. 7

Kotschy disclosed an interesting tandem Sonogashira coupling for the synthesis of bi-aryl acetylenes $\mathbf{2 0}$. The reaction is based on [Pd]- and [ Cu$]$-catalyzed coupling between 2-methyl-3-butyn-2-ols $\mathbf{1 2}$ and aryl halides $\mathbf{1}$ and $\mathbf{2}$. The reaction proceeds through a sequential one-pot process, i.e., initial Sonogashira coupling of aryl halide to give $\mathbf{2 3}$ followed by deprotection of acetylene under the influence of a strong base and then second Sonogashira coupling with aryl halide $\mathbf{2}$ to furnish the bi-aryl acetylenes $\mathbf{2 0}$ (Scheme III.8). ${ }^{88}$

Scheme III. 8

Lee demonstrated a novel approach for the synthesis of bi-aryl alkynes $\mathbf{2 0}$ using the tandem approach based on a [Pd]-catalyzed Sonogashira coupling and a subsequent decarboxylative Sonogashira reaction in one-pot. This method was successful in delivering the symmetrical as well as unsymmetrical bi-aryl or aryl hetero-aryl acetylenes 20 (Scheme III.9). ${ }^{89}$

## Scheme III. 9

Monnier and Taillefer developed cost effective catalytic system for the synthesis of di-substituted alkynes $\mathbf{8}$ in good to excellent yields. This method describes the utility of copper/ligand combination under palladium-free conditions (Scheme III.10). ${ }^{90}$

Scheme III. 10

Lipshutz reported an interesting copper-free [Pd]-catalyzed Sonogashira crosscoupling of aryl bromides $\mathbf{1}$ at ambient temperature in water by the addition of a small amount of nonionic amphiphile PTS (Scheme III.11). ${ }^{91}$

Scheme III. 11

Mao and co-workers developed a practical and cost effective catalytic system for the synthesis of bi-aryl acetylenes 20 by a domino cross coupling of 1,1-dihalo-1-
alkenes $\mathbf{1 4}$ with aryl boronic acids $\mathbf{7}$ in the presence of cheap 8 -hydroxylquinoline as the ligand (Scheme III.12). ${ }^{92}$

Scheme IIII. 12

Rathore carried out the synthesis of bi-aryl acetylene $\mathbf{2 0}$ using [Pd]-catalyzed coupling of commercially available aryl halide $\mathbf{1}$ with gaseous acetylene $\mathbf{1 5}$ (Scheme III.13). ${ }^{93}$

Scheme III. 13

Mio and co-workers implemented a modified Sonogashira cross-coupling for the synthesis of symmetrical as well as unsymmetrical bi-aryl acetylenes 20 in one pot via in-situ deprotection of trimethylsilylethynylene 16 intermediates using amidine base and a sub stoichiometric amount of water (Scheme III.14). ${ }^{94}$

Scheme III. 14

Nishihara described a strategy for the synthesis of bi-aryl acetylenes 20 using $[\mathrm{Pd}] /[\mathrm{Cu}]$-catalyzed sila-Sonogashira coupling of aryl-iodides 2 with an alkyne source bis(trimethylsilyl)acetylene 17 (Scheme III.15). ${ }^{95}$

Scheme III. 15

The research groups of Fand and Shi individually carried out [Pd]-catalyzed cross coupling between aryl iodide $\mathbf{2}$ and bis(tributylstannyl) acetylene $\mathbf{1 8}$ for the synthesis of symmetrical bi-aryl alkynes 20 (Scheme III.16). ${ }^{96}$

Scheme III. 16

## III. 3 RESULTS AND DISCUSSION:

In the wake of a new, efficient and practical methodology for the synthesis of biaryl acetylene, in our quest, we came across numerous methods that appeared in the literature for the synthesis of bi-aryl acetylenes 20. ${ }^{79-96}$ In this regard, as described above, many research groups used different alkyne sources such as terminal aryl alkyne, ${ }^{79-81}$ 2-methylbut-3-yn-2-ol 12, ${ }^{88}$ propiolic acid 9 or 2-ccetylenedicarboxylic acid 11, ${ }^{89}$ gaseous acetylene 15, ${ }^{93}$ trimethylsilyl acetylene $\mathbf{1 6},{ }^{94}$ bis(trimethylsilyl)acetylene 17, ${ }^{95}$ bis(tributylstannyl)acetylene 18. ${ }^{96}$ Nevertheless, the synthesis of bi-aryl acetylenes still remains challenging and there is a need to develop efficient methods. The above methods still suffer from some sort of disadvantages such as high cost of acetylene based reagents, difficulty in handling the gaseous form of acetylene, production of an equivalent of metal or organic waste, use of copper as a co-catalyst and the formation of toxic organometallic waste. On the other hand, some of the approaches made use of expensive palladacycle based catalysts ${ }^{82,87}$ and ionic liquids. ${ }^{83}$ As a part of our ongoing research interest on transition-metal mediated organic transformations in one-pot
fashion, ${ }^{9}$ we envisioned that the synthesis of bi-aryl acetylenes could be achieved under [Pd]-catalysis by the direct cross coupling of commercially available simple lithium acetylide (i.e., as the source of acetylene) with aryl halides, in domino one-pot manner (Scheme III.17).

20

Catalysis

1; $X=B r \quad 19$ 2; $X=1$

19

Scheme III. 17

Thus, the domino Sonogashira cross-coupling of lithium acetylide 19 with aryl halide $\mathbf{1 / 2}$ in the presence of $[\mathrm{Pd}]$-catalyst was screened under different conditions and the results are as summarized in Table III.1. Initially, the reaction with the $\mathrm{Pd}(\mathrm{OAc})_{2}(2$ $\mathrm{mol} \%)$ and $\mathrm{PPh}_{3}(4 \mathrm{~mol} \%)$, in DMA and using $\mathrm{K}_{2} \mathrm{CO}_{3}$ as the base at $100{ }^{\circ} \mathrm{C}$ furnished product 20 i in moderate yield ( $42 \%$, Table III.1, entry 1). There was a further drop in the yield, when the reaction was conducted with the $2-\mathrm{P}(2 \text {-furyl })_{3}(15 \%$, Table III.1, entry 2). Interestingly, the yield was improved to $66 \%$ with the $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$ (Table III.1, entry 3). Similarly, with other ligands such as Diphos, Mephos and dpephos, furnished the product 20i in moderate to good yields, respectively (Table III.1, entries 4 to 6 ). On the other hand, the yield was moderate by changing the ligand to xanthphos (4 $\mathrm{mol} \%)$, in $\mathrm{CH}_{3} \mathrm{CN}$ at $80^{\circ} \mathrm{C}(50 \%$, Table III.1, entry 7). Interestingly, by switching the solvent to DMF, it delivered the product $\mathbf{2 0 i}$ in very good yield ( $80 \%$, Table III.1, entry 8). Also, the ligand dppf proved to be good in DMA solvent (79\%, Table III.1, entry 9). Interestingly, using Xantphos in DMA furnished the product 20i in excellent yield ( $95 \%$, Table III.1, entry 10). The other variation with different bases furnished the product $\mathbf{2 0 i}$ in poor to moderate yields (Table III.1, entries 11 to 13). However, the reaction with excess of aryl bromide $\mathbf{1 i}$ gave the produt $\mathbf{2 0 i}$ in poor yield along with the usual homo bi-aryl product (Table 1, entry 14). While the reaction with $1: 1$ ratio of both

Lithium acetylide ethylenediamine complex and the aryl bromide $\mathbf{1 i}$ was furnished the product $\mathbf{2 0 i}$ in moderate yield (Table 1, entry 15).

Table III.1: Optimization table for the synthesis of bi-aryl acetylene $\mathbf{2 0 i}$.

[^0]Among all the above screened reaction conditions, the conditions mentioned in Table III.1, entry 10 was the best [i.e., $2 \mathrm{~mol} \%$ of $\mathrm{Pd}(\mathrm{OAc})_{2}, 4 \mathrm{~mol} \%$ of and 2.0 equiv of $\mathrm{K}_{2} \mathrm{CO}_{3}$, in DMA as a solvent at $\left.100{ }^{\circ} \mathrm{C}\right]$. Therefore, this condition was applied on
other aryl bromides $\mathbf{1 a - 1 m}$. Delightfully, the method was found amenable to a variety of electron-poor, neutral and electron-rich aryl bromides and furnished the symmetrical bi-aryl acetylenes 20a-20m in very good to excellent yields (60-95\%, Table III.2). Significantly, the reaction showed a wide range of functional group tolerance. For example, halo arenes with alkyl, aryl, alkyloxy, chloro, trifluoromethyl and nitro groups were successful in delivering the products 20a-20m. Interestingly, the reaction was successful with hetero aryl bromides as well.

Even though many methods have been reported on Sonogashira coupling, for the synthesis of bi-aryl acetylenes $\mathbf{2 0}$, some of these methodologies found to be efficient. However, they usually require pre-functionalization of substrates, which impact their atom economy. In this perspective, the present method seems to be very efficient as it makes use of the commercially available cheap lithium acetylide as the acetylene equivalent.

The structure of bi-aryl acetylene 20a was confirmed by IR and NMR data analysis. IR spectra did not show the characteristic absorption band for acetylenic group. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Figure III.1.1), the presence of doublet of a doublet at $\delta 8.39$ having $J=1.5$ and 1.5 Hz accounts for two aromatic protons, doublet of a doublet at $\delta 8.22$ having $J=8.3$ and 1.5 Hz accounts for two aromatic protons, doublet at $\delta 7.85$ having $J=7.8 \mathrm{~Hz}$ accounts for two aromatic protons, doublet of a doublet at $\delta$ 7.57 having $J=7.8$ and 7.8 Hz accounts for another set off two aromatic protons, which elucidated the structure of bi-aryl acetylene 20a. In addition to it, 7 signals appeared in ${ }^{13} \mathrm{C}$-NMR spectrum (Figure III.1.2) in which four quaternary carbon resonates at $\delta$ $148.2(2 \mathrm{C}), 124.0(2 \mathrm{C})$ were due to four aromatic carbon, the presence of eight aromatic methine carbons resonates at $\delta 137.4$ (2C), 129.6 (2C), 126.6 (2C) and 123.6 (2C) and presence $\delta 89.1 \mathrm{ppm}$ was due to acetylenic carbons. The presence of the $[\mathrm{M}+\mathrm{Na}]^{+}$peak at $\mathrm{m} / \mathrm{z}\left[\mathrm{C}_{14} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{NaO}_{4}\right]^{+}=291.0375$ in the mass spectrum further established the structure of bi-aryl acetylene 20a.

Table III.2: Domino [Pd]-catalyzed synthesis of bi-aryl acetylenes 20a-20m from aryl bromides 1a-1m.
200
${ }^{a}$ All reactions were carried out on 0.5 mmol scale of $\mathbf{1}$ in 2 mL of DMA ( 0.25 M$) .{ }^{b}$ Isolated yields of chromatographically pure products. ${ }^{\mathrm{C}}$ Reaction carried out at $150{ }^{\circ} \mathrm{C}$.

## Chloroform-d

Figure III.1.1: ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz})$ spectrum of 20a in $\mathrm{CDCl}_{3}$

Figure III.1.2: ${ }^{13} \mathrm{C}-\mathrm{NMR}(100 \mathrm{MHz})$ spectrum of 20a in $\mathrm{CDCl}_{3}$

After the successful accomplishment of symmetrical bi-aryl aceteylenes 20a-20m using bromoarenes $\mathbf{1 a - 1 m}$ as coupling partners, to further check the scope of the method, we next explored the reaction with iodoarenes $\mathbf{2 a - 2} \mathbf{j}$ as coupling partners. Delightfully, the reaction proved to be efficient with iodoarene coupling partners $\mathbf{2 a} \mathbf{- 2} \mathbf{j}$ as well and gave the products 20a-20r in good to very good yield (65-78\%, Table III.3). Quite interestingly, the reaction showed a very good functional group tolerance, particularly, when there is a bromo substituent along with iodo one on the aromatic ring, the bromo substituent does not involve in the reaction and remains intact in the products 20 n and 200 (Table III.3).

A plausible mechanistic path for the formation of di-aryl alkynes $\mathbf{2 0}$ is as shown in Scheme III.18. The first step is an oxidative addition in which $\operatorname{Pd}(0)$-catalyst inserts into $\operatorname{Ar}-\mathrm{X}(\mathbf{1}$ or $\mathbf{2}$ ) bond to give the aryl $\mathrm{Pd}(\mathrm{II})$-intermediate $\mathbf{A}$. Now, the subsequent reaction with acetylide, would furnish alkynylpalladium(II) species B. Reductive elimination of $\mathbf{B}$ generates the terminal acetylene $\mathbf{C}$. The base mediated de-protonation of the terminal alkyne $\mathbf{C}$ might lead to the acetalyde $\mathbf{D}$, which upon coupling with the $\operatorname{Pd}(\mathrm{II})$-species $\mathbf{A}$ yields the intermediated $\mathbf{E}$. Finally, the reductive elimination of the intermediate $\mathbf{E}$ furnishes the di-aryl alkyne $\mathbf{2 0}$ and $\operatorname{Pd}(0)$ to fulfil the catalytic cycle.

[^1]
## III.4. CONCLUSIONS

A novel and tandem process has been developed for expeditious synthesis of homo bi-aryl acetylenes. Notably, the process was successful in the presence of [Pd]catalyst without the need of [Cu]-catalyst as a co-catalyst. Significantly, the method enabled the use of commercially available cheap lithium acetylide as the equivalent of acetyelene under domino [Pd]-catalysis. This method is applicable to a wide range of bromo or iodoarenes bearing electron withdrawing, neutral, electron rich substituents.

## I. 5 EXPERIMENTAL SECTION:

## General:

IR spectra were recorded on a Bruker Tensor 37 (FT-IR) spectrophotometer. ${ }^{1} \mathrm{H}-$ NMR spectra were recorded on Bruker Avance $400(400 \mathrm{MHz})$ spectrometer at 295 K in $\mathrm{CDCl}_{3}$; chemical shifts ( $\delta$ in ppm) and coupling constants ( $J$ in Hz) are reported in standard fashion with reference to either internal standard tetramethylsilane (TMS) ( $\delta_{\mathrm{H}}=0.00 \mathrm{ppm}$ ) or $\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}}=7.25 \mathrm{ppm}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on Bruker Avance $400(100 \mathrm{MHz})$ spectrometer at RT in $\mathrm{CDCl}_{3}$; chemical shifts ( $\delta$ in ppm) are reported relative to $\mathrm{CHCl}_{3}\left[\delta_{\mathrm{C}}=77.00 \mathrm{ppm}\right.$ (central line of triplet)]. In the ${ }^{13} \mathrm{C}-\mathrm{NMR}$, the nature of carbons ( $\mathrm{C}, \mathrm{CH}, \mathrm{CH}_{2}$ and $\mathrm{CH}_{3}$ ) was determined by recording the DEPT-135 spectra, and is given in parentheses and noted as $s=$ singlet (for C ), $\mathrm{d}=$ doublet (for CH ), $\mathrm{t}=$ triplet (for $\mathrm{CH}_{2}$ ) and $\mathrm{q}=$ quartet (for $\mathrm{CH}_{3}$ ). In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$, the following abbreviations were used throughout: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, qui $=$ quintet, $\mathrm{m}=$ multiplet and br. s=broad singlet, septd=septet of doublets. The assignment of signals
was confirmed by ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ CPD and DEPT spectra. High-resolution mass spectra (HRMS) were recorded on an Agilent 6538 UHD Q-TOF using multimode source. All small scale dry reactions were carried out using the standard syringe-septum technique. Reactions were monitored by TLC on a silica gel using a mixture of petroleum ether and ethyl acetate as eluents. Reactions were generally run under an argon or nitrogen atmosphere. All solvents were distilled prior to use; petroleum ether with a boiling range of 60 to $80^{\circ} \mathrm{C}$, ethyl acetate, DMF (with purity $99 \%$ ), DMA (with purity $99 \%$ ), Acetonitrile (with purity $99.9 \%$ ), Triethylamine (with purity $98 \%$ ) and silica gel (60120 mesh) purchased from locally available commercial sources were used. Palladium(II)acetate (with purity 98\%), 4,5-Bis(diphenylphosphino)-9,9dimethylxanthene (Xantphos ) (with purity 97\%), 1,1'-bis(diphenylphosphino)ferrocene (dppf) (with purity 97\%), triphenylphosphine $\left(\mathrm{PPh}_{3}\right)$ (with purity $99 \%$ ), Tri(2furyl)phosphine (with purity 99\%), Ethylenebis(diphenylphosphine)( Diphos) (with purity $99 \%$ ), $\quad \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}$ (with purity 98\%), 2-Dicyclohexylphosphino-2'-methylbiphenyl,2-Methyl-2'-dicyclohexylphosphinobiphenyl (MePhos) (with purity 97\%), (Oxydi-2,1-phenylene)bis(diphenylphosphine) (DPEPhos) (with purity 98\%), N,N-diisopropylethylamine (DIPEA) (with purity 99\%), N,NDicyclohexylmethylamine (with purity $97 \%$ ), lithium acetylide ethylenediamine complex (with assay $90 \%$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ (with purity $99 \%$ ) purchased from Sigma-Aldrich were used without further purification. The base $\mathrm{K}_{2} \mathrm{CO}_{3}$ was dried at $150-170{ }^{\circ} \mathrm{C}$ over an oil bath. DMF and DMA dried over calcium hydride. Acetonitrile dried over $\mathrm{P}_{2} \mathrm{O}_{5}$. Triethylamine dried over KOH. Acme's silica gel (60-120 mesh) was used for column chromatography (approximately 20 g per one gram of crude material).
The compounds 20n and 200, ${ }^{97}$ know in the literature.

## General Procedure-1 for Pd-Mediated bi-aryl acetylene synthesis (GP-1):

In an oven dried Schlenk tube under nitrogen atmosphere, were added aryl halide $\mathbf{1}$ ( 0.50 mmol ), $\mathrm{Pd}(\mathrm{OAc})_{2}(2 \mathrm{~mol} \%)$, Xantphos $(4 \mathrm{~mol} \%), \mathrm{K}_{2} \mathrm{CO}_{3}(1.0 \mathrm{mmol})$ and lithium acetylide ethylenediamine complex $19(1.0 \mathrm{mmol})$ followed by addition of dry DMA (2
mL ). The resulted reaction mixture was stirred at $100{ }^{\circ} \mathrm{C}$ for 15 min to 12 h . The progress of the reaction was monitored by TLC till the reaction was completed. The reaction mixture was then quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution and the aqueous layer was extracted with ethyl acetate $(3 \times 20 \mathrm{~mL})$. The organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate) furnished the product 20 (60-95\%).

20a
1-Nitro-3-[(3-nitrophenyl)ethynyl]benzene (20a): GP-1 was carried out with aryl bromide $1 \mathbf{1 a}(101 \mathrm{mg}, 0.50 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $11.6 \mathrm{mg}, 4$ $\mathrm{mol} \%), \mathrm{K}_{2} \mathrm{CO}_{3}(138 \mathrm{mg}, 1.00 \mathrm{mmol})$, lithium acetylide ethylenediamine complex 19 $(102 \mathrm{mg}, 1.0 \mathrm{mmol})$ and dry DMA ( 2 mL ). The resulted reaction mixture was stirred at preheated oil bath $100{ }^{\circ} \mathrm{C}$ for 0.25 h . Purification of the residue on a silica gel column chromatography (petroleum ether/ethyl acetate $90: 10$ to $85: 15$ ) furnished the product 20a ( $50 \mathrm{mg}, 75 \%$ ). [TLC control $R_{f}(\mathbf{1 a})=0.60, R_{f}(\mathbf{2 0 a})=0.45$ (petroleum ether/ethyl acetate 80:20, UV detection)].

Reaction with aryl iodide: GP-1 was carried out with aryl iodide $\mathbf{2 a}$ ( $124 \mathrm{mg}, 0.50$ $\mathrm{mmol})$ for 0.25 h furnished the product ( 46 mg , 69\%) [TLC control $R_{f}(\mathbf{2 a})=0.70$, $R_{f}(\mathbf{2 0 a})=0.45$ (petroleum ether/ethyl acetate 80:20, UV detection)].

IR (MIR-ATR, 4000-600 $\mathbf{~ c m}^{-1}$ ): $v_{\max }=3082,2958,2922,2853,1529,1402$, 1352, 1236, 904, 823, 805, 734, $670 \mathrm{~cm}^{-1}$.
${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{4 0 0} \mathbf{~ M H z}\right): \delta=8.39(\mathrm{dd}, 2 \mathrm{H}, J=1.5$ and $1.5 \mathrm{~Hz}, 2 \times \mathrm{Ar}-\mathrm{H})$, $8.22(\mathrm{dd}, 2 \mathrm{H}, J=8.3$ and $1.5 \mathrm{~Hz}, 2 \times \mathrm{Ar}-\mathrm{H}), 7.85(\mathrm{~d}, 2 \mathrm{H}, J=7.8 \mathrm{~Hz}, 2 \times \mathrm{Ar}-\mathrm{H}), 7.57(\mathrm{dd}$, $2 \mathrm{H}, J=7.8$ and $7.8 \mathrm{~Hz}, 2 \times \mathrm{Ar}-\mathrm{H}) \mathrm{ppm}$.
${ }^{13} \mathbf{C}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}\right): \delta=148.1(\mathrm{~s}, 2 \mathrm{C}, 2 \times \mathrm{Ar}-\mathrm{C}), 137.3(\mathrm{~d}, 2 \mathrm{C}, 2 \times \mathrm{Ar}-$ C), 129.6 (d, 2C, $2 \times$ Ar-C), 126.5 (d, 2C, $2 \times$ Ar-C), 124.0 (d, 2C, $2 \times$ Ar-C), 123.6 (d, $2 \mathrm{C}, 2 \times \mathrm{Ar}-\mathrm{C}$ ), 89.1 (s, 2C, $2 \times \mathrm{Ar}-\mathrm{C} \equiv) \mathrm{ppm}$.

HR-MS (ESI ${ }^{+}$): m/z calculated for $\left[\mathrm{C}_{14} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{NaO}_{4}\right]^{+}=[\mathrm{M}+\mathrm{Na}]^{+}: 291.0376$; found 291.0368.

20b
(Phenylethynyl)benzene (20b): GP-1 was carried out with aryl bromide $\mathbf{1 b} \mathbf{( 7 8 . 5} \mathbf{m g}$, $0.50 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $11.6 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(138$ $\mathrm{mg}, 1.00 \mathrm{mmol}$ ), lithium acetylide ethylenediamine complex 19 ( $102 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) and dry DMA ( 2 mL ). The resulted reaction mixture was stirred at preheated oil bath $100{ }^{\circ} \mathrm{C}$ for 1 h . Purification of the residue on a silica gel column chromatography (petroleum ether) furnished the product 20b ( $50 \mathrm{mg}, 88 \%$ ) as white solid. [TLC control $R_{f}(\mathbf{1 b})=0.80, R_{f}(\mathbf{2 0 b})=0.80$ (petroleum ether/ethyl acetate 95:5, UV detection)].

Reaction with aryl iodide: GP-1 was carried out with aryl iodide $\mathbf{2 b}$ ( $102 \mathrm{mg}, 0.50$ mmol ) for 0.25 h furnished the product $\mathbf{2 0 b}$ ( $31 \mathrm{mg}, 70 \%$ ) [TLC control $R_{f}(\mathbf{2 b})=0.85$, $R_{f}(\mathbf{2 0 b})=0.80$ (petroleum ether, UV detection)].

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{-1}$ ): $v_{\max }=2957,2922,2852,1602,1498,1442$, 1260, 1069, 1025, 799, 753, $688 \mathrm{~cm}^{-1}$.
${ }^{1} \mathbf{H}-\mathrm{NMR}\left(\mathbf{C D C l}_{3}, 400 \mathrm{MHz}\right): \delta=7.57(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.36(\mathrm{~m}, 6 \mathrm{H}, \mathrm{Ar}-\mathrm{H}) \mathrm{ppm}$.
${ }^{13} \mathbf{C}-\mathbf{N M R}\left(\mathbf{C D C l}_{3}, \mathbf{1 0 0} \mathbf{~ M H z}\right): \delta=131.6(\mathrm{~d}, 4 \mathrm{C}, 4 \times \mathrm{Ar}-\mathrm{CH}), 128.3(\mathrm{~d}, 4 \mathrm{C}, 4 \times$ Ar-CH), 128.2 (d, 2C, $2 \times \mathrm{Ar}-\mathrm{CH}$ ), 123.2 (s, 2C, $2 \times \mathrm{Ar}-\mathrm{C}$ ), 89.4 (s, 2C, $2 \times \mathrm{Ar}-\mathrm{C} \equiv$ ) ppm.

20c
1-(1-Naphthylethynyl)naphthalene (20c): GP-1 was carried out with aryl bromide 1c ( $103.5 \mathrm{mg}, 0.50 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 2 \mathrm{~mol} \%)$, Xantphos ( $11.6 \mathrm{mg}, 4 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(138 \mathrm{mg}, 1.00 \mathrm{mmol})$, lithium acetylide ethylenediamine complex $19(102 \mathrm{mg}$, $1.0 \mathrm{mmol})$ and dry DMA $(2 \mathrm{~mL})$. The resulted reaction mixture was stirred at preheated oil bath $100{ }^{\circ} \mathrm{C}$ for 1 h . Purification of the residue on a silica gel column
chromatography (petroleum ether/ethyl acetate $98: 2$ to $97: 3$ ) furnished the product 20c ( $57 \mathrm{mg}, 83 \%$ ). [TLC control $R_{f}(\mathbf{1 c})=0.80, R_{f}(\mathbf{2 0 c})=0.70$ (petroleum ether/ethyl acetate 95:5, UV detection)].

IR (MIR-ATR, 4000-600 $\mathbf{c m}^{-1}$ ): $v_{\max }=3053,2955,2923,2852,1700,1585$, 1504, 1404, 1213, 1017, 862, 796, $770 \mathrm{~cm}^{-1}$.

## ABOUT THE AUTHOR

The author, Mr. Jonnada Krishna, was born on $25^{\text {th }}$ August, 1984 at Hyderbad, Telangana, India. He had his early education (SSC) in 1999 at Govt. Boys High School, Hyderabad, Telangana. He completed his intermediate education from Govt. City Junior College, Hyderabad, Telangana in 2001 and obtained a B.Sc. (M. P. C) degree in 2004 from the Govt. City College, Hyderabad, Telangana. He obtained his M.Sc. degree (Organic Chemistry) in 2007 from the P.G. College of Science. Osmania University, Hyderabad, Telangana. He has two and half year industrial research experience from Dr. Reddy's Laboratories Pvt. Ltd. (Integrated Product Development Organization), then he joined in the Department of Chemistry for the Ph. D. program at Indian Institute of Technology (IIT) Hyderabad, under the supervision of Dr. G. Satynarayana. He passed the comprehensive examination in May 2011.

1. Palladium mediated highly regio- and stereoselective intermolecular $\beta$-arylation on allylic alcohols: Synthesis of functionalized allylic alcohols, Krishna, J.; Reddy, A. G. K.; Ramulu, B. V.; Mahendar, L.; Satyanarayana, G.; Synlett 2012, 23, 375-380.
2. A domino palladium catalysis: Synthesis of 7-methyl-5H-dibenzo $[a, c][7]$ annulen-5-ones, Krishna, J.; Reddy, A. G. K.; Satyanarayana, G.; Synlett 2013, 24, 967-972.
3. Formation of bi-aryls via a domino palladium-catalysis, Krishna, J.; Reddy, A. G. K.; Satyanarayana, G.; Tetrahedron Lett. 2013, 55, 861-864.
4. Palladium catalyzed selective $\alpha$-arylation of ortho-bromoacetophenones, Krishna, J.; Reddy, A G K.; Satyanarayana, G.; Synth. Commun. 2014, 44, 2103-2111.
5. Sequential One-Pot Approach for the Synthesis of Functionalized Phthalans via Heck-Reduction-Cyclization (HRC) Reactions. Krishna, J.; Niharika, P.; Satyanarayana, G. RSC Adv., 2015, 5, 26749-26761.
6. [Pd]-Catalyzed Domino Process: Synthesis of Symmetrical Di-aryl Alkynes Using Lithium Acetylide as a Synthon Krishna, J.; Satyanarayana, G. (submitted)
7. Palladium mediated intramolecular Buchwald-Hartwig $\alpha$-arylation of aminoesters: Synthesis of functionalized tetrahydroisoquinosignals, Reddy, A. G. K.; Krishna, J.; Satyanarayana, G.; Synlett 2011, 12, 1756-1760.
8. A domino palladium-catalyzed $\mathrm{C}-\mathrm{C}$ and $\mathrm{C}-\mathrm{O}$ bonds formation via dual $\mathrm{O}-\mathrm{H}$ bond activation: Synthesis of 6,6-dialkyl-6H-benzo[c]chromenes, Mahendar, L.; Krishna, J.; Reddy, A. G. K.; Ramulu, B. V.; Satyanarayana, G.; Org. Lett., 2012, 14, 628-631.
9. An efficient intermolecular [Pd]-catalyzed $\mathrm{C}-\mathrm{C}$ and intramolecular $[\mathrm{Cu}]-$ catalyzed C-O bonds formation: Synthesis of functionalized flavans and benzoxepines, Suchand, B.; Krishna, J.; Ramulu, B. V.; Dibyendu, D.; Reddy, A. G. K.; Mahendar, L.; Satyanarayana, G.; Tetrahedron Lett. 2012, 53, 38613864.
10. An efficient sequential one-pot base mediated C-O and Pd-mediated C-C bonds formation: Synthesis of functionalized cinnamates and isochromenes, Reddy, A. G. K.; Krishna, J.; Satyanarayana, G.; Tetrahedron Lett. 2012, 50, 5635-5640.
11. Sequential one-pot method for oxy-Michael addition, Heck coupling and degradation followed by condensation: Facile synthesis of 2-benzoxepin-3(1H)-
ones, Reddy, A. G. K.; Krishna, J.; Satyanarayana, G.; Tetrahedron 2013, 69, 10098-10107.
12. Lewis acid promoted $\mathrm{C}-\mathrm{C}$ and copper-catalyzed $\mathrm{C}-\mathrm{O}$ bonds formation: Synthesis of neoflavans, Suchand, B.; Krishna, J.; Mritunjoy, K.; Satyanarayana, G.; RSC Adv., 2014, 4, 13941-13945.
13. Concise three step strategy for the synthesis of 2-benzoxepin-3(1H)-ones, Madhurima, H, Krishna, J.; Satyanarayana, G. Synthesis 2015, 47, 1245-1254.
14. Transition metals catalyzed $\mathrm{C}-\mathrm{C}$ and $\mathrm{C}-\mathrm{O}$ bonds formation: Facile synthesis of flavans and benzoxepines, Ramulu, B. V.; Mahendar, L.; Krishna, J.; Reddy, A. G. K.; Suchand, B.; Satyanarayana, G.; Tetrahedron 2013, 69, 8305-8315.
15. An efficient synthesis of highly substituted indanones and chalcones promoted by superacid, Das, A.; Reddy, A. G. K.; Krishna, J.; Satyanarayana, G.; RSC Adv., 2014, 4, 26662-26666.
16. An efficient [Cu]-catalyzed domino Sonogashira coupling followed by intramolecular 5-exo-dig cyclization, Mahendar, L.; Reddy, A. G. K.; Krishna, J.; Satyanarayana, G; J. Org. Chem., 2014, 79, 8566-8576.
